

**SICK Motor feedback systems
Operating instructions**

1 About this document

Please read these operating instructions carefully before using the EFS50-0/EFM50-0 motor feedback system or mounting it, putting it into operation or servicing it.

1.1 Purpose of this document

These operating instructions are for giving technical personnel of the machine manufacturer or operator instructions on the assembly, electrical installation, commissioning, operation and maintenance of EFS50-0/EFM50-0 motor feedback systems.

1.2 Symbols used

⚠ Safety notes

A warning indicates a specific or potential hazard. This is intended to protect you against accidents. Read the safety notes carefully and follow them.

1.3 Associated documents

The "HIPERFACE DSL®" interface manual, order number 8017595, as of 05.2014 (or newer)

1.4 Maintenance and repairs

The EFS50-0/EFM50-0 motor feedback system is maintenance-free. No repair option is provided in case of a defect. Please contact us if you have any complaints.

1.5 Disposal

▶ Always dispose of unusable or irreparable devices in accordance with the applicable waste disposal regulations specific to your country.

Note

We would be happy to help you dispose of these devices. Please contact us.

2 Product description

EFS50-0/EFM50-0 -type encoders are motor feedback systems that are ideal for the dynamic and precise operation of servo-control circuits due to their equipment.

The overall system, consisting of encoder, evaluation system, servo inverter and motor, forms a control circuit. Actual values for commutation, rotational speed, direction of rotation and position are derived from the encoder signals.

The sensor signals are transferred to the evaluation system via a HIPERFACE DSL® interface.

⚠ Safety notes

The EFS50-0/EFM50-0 motor feedback system is not a safety component. The motor feedback systems of the EFS50-2/EFM50-2 type must be used in the event of use intended as part of a safety function.

3 Generally applicable notes

Switch off the power of all affected machines/units during the mounting process.

Make sure to avoid any blows or impact to the shaft under all circumstances to prevent damage to the ball bearings.

Using the stator coupling for the motor feedback system, the housing must be correctly seated in the customer's flange arrangement.

The more precise the centering for the motor feedback system, the less the angle and shaft offset during mounting and the less load on the bearings of the motor feedback system.

EMC considerations make it mandatory to connect the housing or the encoder to ground.

For the EFS50-0/EFM50-0 with conical shaft and spring mounting plate, this is ensured by the stator coupling.

For the EFS50-0/EFM50-0 with conical shaft and resolver support, this has to be ensured using a separate shielding connection.

⚠ Shielding connection

To ensure trouble-free operation, ensure that the motor shielding is connected properly.

3.1 Preparations for attachment

- ▶ Remove any protective film present on the back of the motor feedback system.
- ▶ Degrease the drive shaft and shaft of the motor feedback system if necessary.
- ▶ Look for any damage!

5 Motor feedback system with tapered shaft and resolver support (Fig. 4)

5.1 Tools/parts required

Fastening using the servo groove requires servo clamps and M4 screws; select the screw length according to the mounting conditions. A Torx T15 tool is required for mounting/removing the screw (3).

5.2 Mounting

- ▶ Block the customer's drive shaft.
- ▶ Carefully push the encoder (1) onto the motor shaft. Ensure that the stator coupling (2) is cleanly positioned in the centering part for the motor.
- ▶ Tighten the screw (3).
- ▶ **Screw tightening torque (3): 3.1 Nm.**
- ▶ If you use a screw other than one of the provided screws coated with TufLok®, apply liquid thread locker to the start of the screw thread.
- ▶ Fasten the stator coupling (2) at a minimum of 3 points on the motor. You can use a variety of means to fasten it, such as using servo clamps (4) and screws (5) or clamping jaws and/or a clamping ring.
- ▶ Fully tighten the screws (5) to prevent them from working loose.
- ▶ Connect the shielding connection (13).

5.3 Removal

- ▶ Block the customer's drive shaft.
- ▶ Open the cover (8) using a screwdriver if necessary.
- ▶ De-energize and disconnect the set of stranded wires (6 + 7) and the shielding connection (13).
- ▶ Unscrew the screws (5) on the stator coupling (2) and remove them.
- ▶ Unscrew the screw (3) and remove it.
- ▶ The encoder can be removed.

6 Electrical installation

⚠ Safety note

Observe the following points in relation to electrical installation of the EFS50-0/EFM50-0 motor feedback system.

- ▶ To connect the sensors, refer to the corresponding perating instructions for the external drive system or for the higher-order control system.
- ▶ Never establish or remove electrical connections to the motor feedback system with the power connected, since that could result in a faulty device.

6.1 Interface connection

- ▶ Open the cover (8) using a screwdriver if necessary.
- ▶ While de-energized, stick the male connector (11) for the set of stranded wires (6) into the socket (9) on the encoder far enough that it clicks into place.
- ▶ Close the cover (8) (allow it to snap in place in the cut-out on the encoder housing (1)).
- ▶ You should be able to feel and hear it click into place.

6.2 Temperature sensor connection (only EFS50-0K, EFM50-0K variants)

▶ While de-energized, insert the male connector for the temperature sensor (12) into the socket (10).

⚠ Safety note

Since there is no electrical isolation of the temperature sensor in the motor feedback system, only temperature sensors with doubled or reinforced insulation may be used.

6.3 Signals in the encoder system

The EFS50-0/EKM50-0 motor feedback system features the following signals from the HIPERFACE DSL® interface:

- ▶ +U_s / DSL+: Supply voltage to the encoder with modulated positive data signal. The supply voltage range of the encoder is between +7 V and +12 V.
- ▶ GND / DSL-: Ground connection of the encoder with modulated negative data signal. The supply voltage range of the encoder is between +7 V and +12 V.
- ▶ T+: Sensor signal for passive temperature sensor/temperature resistor.
- ▶ T- / GND: Reference ground for sensor signal of passive temperature sensor/temperature resistor.

6.4 Radial and axial stranded wire outlet

The EFS50-0/EKM50-0 motor feedback system enables a radial (Fig. 5) or axial (Fig. 6) outlet for the stranded wire electrical connections.
