4.4.7 Overview of Error Blink Codes ..... 240
4.5 Bit Field for I/O Driver ..... 255
4.6 Configuration Variables ..... 276
4.7 Internal State Variables ..... 292

## 1 Important Notes

This section includes an overall summary of the most important safety requirements and notes that are mentioned in each individual section. To protect your health and prevent damage to devices as well, it is imperative to read and carefully follow the safety guidelines.

### 1.1 Legal Bases

### 1.1.1 Copyright

This Manual, including all figures and illustrations, is copyright-protected. Any further use of this Manual by third parties that violate pertinent copyright provisions is prohibited. Reproduction, translation, electronic and phototechnical filing/archiving (e.g., photocopying) as well as any amendments require the written consent of WAGO Kontakttechnik GmbH \& Co. KG, Minden, Germany. Non-observance will involve the right to assert damage claims.

WAGO Kontakttechnik GmbH \& Co. KG reserves the right to provide for any alterations or modifications that serve to increase the efficiency of technical progress. WAGO Kontakttechnik $\mathrm{GmbH} \& \mathrm{Co}$. KG owns all rights arising from the granting of patents or from the legal protection of utility patents. Third-party products are always mentioned without any reference to patent rights. Thus, the existence of such rights cannot be excluded.

### 1.1.2 Personnel Qualifications

The use of the product described in this Manual requires special personnel qualifications, as shown in the following table:

| Activity | Electrical specialist | Instructed <br> personnel*) | Specialists**) having <br> qualifications in PLC <br> programming |
| :--- | :---: | :--- | :--- |
| Assembly | $\mathbf{X}$ | $\mathbf{X}$ |  |
| Commissioning | $\mathbf{X}$ |  | $\mathbf{X}$ |
| Programming |  |  | $\mathbf{X}$ |
| Maintenance | $\mathbf{X}$ | $\mathbf{X}$ |  |
| Troubleshooting | $\mathbf{X}$ |  |  |
| Disassembly | $\mathbf{X}$ | $\mathbf{X}$ |  |

*) Instructed persons have been trained by qualified personnel or electrical specialists.
**) A specialist is a person, who - thanks to technical training - has the qualification, knowledge and expertise to meet the required specifications of this work and to identify any potential hazardous situation in the above listed fields of activity.

All responsible persons have to familiarize themselves with the underlying legal standards to be applied. WAGO Kontakttechnik GmbH \& Co. KG does not assume any liability whatsoever resulting from improper handling and damage incurred to both WAGO's own and third-party products by disregarding detailed information in this Manual.

### 1.1.3 Use of the 750 Series in Compliance with Underlying Provisions

Couplers, controllers and I/O modules found in the modular WAGO-I/OSYSTEM 750 receive digital and analog signals from sensors and transmit them to the actuators or higher-level control systems. Using programmable controllers, the signals can also be (pre-)processed.

The components have been developed for use in an environment that meets the IP20 protection class criteria. Protection against finger injury and solid impurities up to 12.5 mm diameter is assured; protection against water damage is not ensured. Unless otherwise specified, operation of the components in wet and dusty environments is prohibited.

### 1.1.4 Technical Condition of Specified Devices

The components to be supplied Ex Works, are equipped with hardware and software configurations, which meet the individual application requirements. Changes in hardware, software and firmware are permitted exclusively within the framework of the various alternatives that are documented in the specific manuals. WAGO Kontakttechnik $\mathrm{GmbH} \& \mathrm{Co}$. KG will be exempted from any liability in case of changes in hardware or software as well as to noncompliant usage of components.

Please send your request for modified and new hardware or software configurations directly to WAGO Kontakttechnik GmbH \& Co. KG.

### 1.2 Standards and Guidelines for Operating the 750 Series

Please adhere to the standards and guidelines required for the use of your system:

- The data and power lines shall be connected and installed in compliance with the standards required to avoid failures on your system and to substantially minimize any imminently hazardous situations resulting in personal injury.
- For assembly, start-up, maintenance and troubleshooting, adhere to the specific accident prevention provisions which apply to your system (e.g. BGV A 3, "Electrical Installations and Equipment").
- Emergency stop functions and equipment shall not be made ineffective. See relevant standards (e.g. DIN EN 418).
- The equipment of your system shall be conform to EMC guidelines so that any electromagnetic interferences will be eliminated.
- Operating 750 Series components in home applications without further measures is permitted only if they meet the emission limits (emissions of interference) in compliance with EN 61000-6-3. You will find the detailed information in section "WAGO-I/O-SYSTEM 750" $\rightarrow$ "System Description" $\rightarrow$ "Technical Data".
- Please observe the safety precautions against electrostatic discharge in accordance with DIN EN 61340-5-1/-3. When handling the modules, please ensure that environmental factors (persons, working place and packaging) are well grounded.
- The valid standards and guidelines applicable for the installation of switch cabinets shall be adhered to.

### 1.3 Symbols

## Danger

Always observe this information to protect persons from injury.

## Warning

Always observe this information to prevent damage to the device.

## Attention

Marginal conditions that must always be observed to ensure smooth and efficient operation.

ESD (Electrostatic Discharge)
Warning of damage to the components through electrostatic discharge. Observe the precautionary measure for handling components at risk of electrostatic discharge.

## Note

Make important notes that are to be complied with so that a trouble-free and efficient device operation can be guaranteed.

## Additional Information

References to additional literature, manuals, data sheets and internet pages.

### 1.4 Safety Information

When connecting the device to your installation and during operation, the following safety notes must be observed:

## Danger

The WAGO-I/O-SYSTEM 750 and its components are an open system. It must only be assembled in housings, cabinets or in electrical operation rooms. Access is only permitted via a key or tool to authorized qualified personnel.

## Danger

All power sources to the device must always be switched off before carrying out any installation, repair or maintenance work.

## Warning

Replace defective or damaged device/module (e.g. in the event of deformed contacts), as the functionality of field bus station in question can no longer be ensured on a long-term basis.

## Warning

The components are not resistant against materials having seeping and insulating properties. Belonging to this group of materials is: e.g. aerosols, silicones, triglycerides (found in some hand creams). If it cannot be ruled out that these materials appear in the component environment, then the components must be installed in an enclosure that is resistant against the above mentioned materials. Clean tools and materials are generally required to operate the device/module.

## Warning

Soiled contacts must be cleaned using oil-free compressed air or with ethyl alcohol and leather cloths.

## Warning

Do not use contact sprays, which could possibly impair the functioning of the contact area.

## Warning

Avoid reverse polarity of data and power lines, as this may damage the devices.

## ESD (Electrostatic Discharge)

The devices are equipped with electronic components that may be destroyed by electrostatic discharge when touched.

Warning
For components with ETHERNET/RJ-45 connectors:
Only for use in LAN, not for connection to telecommunication circuits.

### 1.5 Font Conventions

| italic | Names of paths and data files are marked in italic-type. <br> e.g.: C: $\mid$ Programs $\mid W A G O-I O-C H E C K$ |
| :--- | :--- |
| italic | Menu items are marked in italic-type, bold letters. <br> e.g.: Save |
| END | A backslash between two names characterizes the selection of a <br> menu point from a menu. <br> e.g.: File $\backslash$ New |
| Pushbuttons are marked as bold with small capitals |  |
| e.g.: EnTER |  |$\quad$| Keys are marked bold within angle brackets |
| :--- |
| e.g.: <F5> |

### 1.6 Number Notation

| Number code | Example | Note |
| :--- | :--- | :--- |
| Decimal | 100 | Normal notation |
| Hexadecimal | $0 \times 64$ | C notation |
| Binary | $' 100^{\prime}$ <br> $' 0110.0100^{\prime}$ | In quotation marks, <br> nibble separated with dots (.) |

### 1.7 Scope

This manual describes the Special Module 750-672 Stepper controller of the modular WAGO-I/O-SYSTEM 750.

Handling, assembly and start-up are described in the manual of the Fieldbus Coupler. Therefore this documentation is valid only in the connection with the appropriate manual.

## 2 I/O Modules

### 2.1 Special Modules

### 2.1.1 General Description

### 2.1.1.1 Safety Information

Observe the following information and notices to prevent injury and damage to persons and equipment.

## Danger

Take appropriate measures, such as cordoning off appropriate areas with screens/enclosures, to prevent bodily contact with the system's moving parts.

## Danger

Enact and install an EMERGENCY OFF procedure and system that adheres to locally valid regulations and applicable engineering practices.

## Note

Install appropriate hardware limit switches that can directly disengage power to the system if a restricted area of movement has been breached.

## Note

Install appropriate equipment to protect motors and power electronics, such as motor circuit breakers or fuses.

### 2.1.1.2 Structure of Positioning Controller

The following figure illustrates the structure of a typical positioning controller, along with the basic elements:

- Control section,
- Power section,
- Drive,
- Mechanical section.

Fig. 2.1.1-1: Structure of position control system

### 2.1.1.2.1 Control Section

The control section consists of the PLC for process control and the stepper module $750-67 \mathrm{x}$ for positioning, FM and PWM functions.

### 2.1.1.2.2 Power Stage

The power stage generates the requisite drive currents from the pulses for the specific motor. Any type of output stage equipped with a pulse direction or incremental encoder interface can be used with the stepper module 750-670. This also allows output stages for 3- or 5-pole stepper motors or DC or AC servo motors to be used. Stepper modules 750-671, -672 and -673 are equipped with an integrated output stage for regulating 2-phase stepper motors.

### 2.1.1.2.3 Drive system

Stepper motors are simple and economical drives for high-precision tasks for the most varying of applications.

The shaft of a stepper motor rotates by a defined angle at each pulse; a rapid succession of pulses transforms this stepping motion into a continuous turning motion. The natural resonance of stepper motors is greatly suppressed in particular by extremely smooth running produced through microstepping at high resolution, as used in the WAGO modules 750-671, -672 and -673, with 64 -fold microstepping.

The figures below illustrate possible types of connections for stepper motors.

Fig. 2.1.1-2: Types of connections for stepper motors

6-wire-motor bipolar in series operated

8-wire-motor bipolar parallel operated

In addition to the type of connection and the number of phases, the requisite torque progression over speed, along with the motor current necessary for this and the winding resistance and the motor inductance must also be taken into account when selecting an appropriate motor.

The torque progression and speed are dictated by the application to be implemented. Practical experience has shown that a torque margin of approximately $25 \%$, depending on the mechanical system properties, has proven useful. This should be taken into consideration to account for any dynamic effects (resonance in mechanical systems).

The positioning process sequences also determines the average and peak power supplied to the motor; special attention must be given here to the total power loss and temperature of the motor.

Depending on the motor model and design, a corresponding current must be present that must be transferred from the output stage into the motor. The voltage required for this depends on the winding resistance, motor inductance and speed (anti-EMC). It may therefore be necessary to have considerably higher voltage levels for the specific current level, in particular at high speeds, than that specified by the motor data. The motor data provided by the manufacturers is based on motor standstill (ohmic winding resistance). As the power output stages of the stepper modules 750-671, -672 and -673 are equipped with power control systems, it is no problem, for example, to run 12 V motors with 24 V supply systems, as long as the current, power loss and temperature of the motor remain within acceptable limits. Consult the motor manufacturer if you have any doubts or questions.

### 2.1.1.2.4 Mechanical Section

The requisite motor data can be calculated based on the requirements concerning the load to be moved, and any additional bearings, transmissions, deflection systems, damping elements, etc. that may be required. Important parameters to consider are: moment of inertia, starting torque holding torque torque at the maximum required speed cycle times for positioning requisite acceleration required torque (where applicable) when passing through mechanical resonance fields - particularly when mechanical components such as long drive belts, spring elements or vibration buffers (couplings) are used. There must be no step losses if the requisite mechanical torque does not exceed the torque supplied by the motor (taking into account its own inertia)!

### 2.1.1.3 Positioning

A distinction is made here between absolute and relative positioning. In addition, a difference is also made between a reference run and the Jog mode.

### 2.1.1.3.1 Absolute Positioning

Positioning from the absolute position X to absolute position Y .

Fig. 2.1.1-3: Absolute positioning
Potential applications:

- Positioning shafts
- Transfer carriages
- Pick \& Place

### 2.1.1.3.2 Relative Positioning

Positioning from absolute position X to absolute position Y by the difference x . Also possible as a command during positioning (on the fly).

Fig. 2.1.1-4: Relative positioning
Potential applications:

- Incremental dimensions
- Variable reference points

### 2.1.1.3.3 On-the-Fly Positioning

Termination of ongoing positioning (such as Move to Y ) and execution of the new positioning command (Move to Y-n).

Fig. 2.1.1-5: On-the-fly positioning
Potential applications:

- Event-dependent changing of target position
- Avoidance of collisions
- Process optimization

### 2.1.1.3.4 Referencing

Referencing is the setup of a measuring system. A distinction is drawn here between referencing to a limit switch and referencing to a special reference switch. A high degree of reproducible accuracy is essential for referencing. Referencing should therefore always be performed from the same end.

Referencing involves searching for the reference switch at the set setup speed and then moving toward that point from the correct end from any position with the movement range.

Fig. 2.1.1-6: Referencing
The reference value (usually 0 ) is accepted at the corresponding edge.

### 2.1.1.3.5 Jogging Mode

The drive is run at the setup speed via a defined input, or a control bit, as long as the input is active, or as long as the bit is set. A time limit can be activated for the moving process.

### 2.1.1.3.6 Rotary Axis

The value range (such as $-10000 \ldots+10000$ ) is converted for rotation $\left(360^{\circ}\right)$ around a real or virtual axis for a rotary axis. Overrun is taken into account automatically here, i.e. when $360^{\circ}$ is exceeded, counting is restarted at $0^{\circ}$. Based on the example values, after exceeding the +10000 position, the next position would be -10000 .

When specifying the parameters for the rotary axis, the following restriction must be observed for the function to be implemented correctly.

$$
v \leq \frac{\text { Speed_Div }}{\text { Speed_Mult }} * \frac{\text { Freq_Div }}{80} * 10^{3} * p
$$

| v | Maximum allowed setpoint speed |
| :--- | :--- |
| p | Rotary axis periods (parameter 64, Rotary_Axis_Period) <br> Speed_Mult <br> Scaling factor for setpoint speed <br> (parameter 28 from configuration table) |
| Speed_Div | Scaling factor for setpoint speed <br> (parameter 30 from configuration table) |
| Freq_Div | Prescaler for maximum speed <br> (parameter 4 from configuration table) |

Potential applications:

- Belt control
- Label supply
- Control of rotary tables

### 2.1.1.3.7 Types of Acceleration

### 2.1.1.3.7.1 Constant Acceleration

Acceleration has the same value during the entire acceleration phase. Both the onset and completion of acceleration phase jolt the mechanical system; this phenomenon is comparable to the jolt a vehicle experiences when stepping on/stepping off the accelerator.

Fig. 2.1.1-7: Constant acceleration
Potential applications:

- Peak acceleration at specified acceleration value,
- Linear path/time response.

### 2.1.1.3.7.2 Linear Acceleration

Acceleration increases and decreases during the acceleration phase with a linear gradient.
This reduces the jolt experienced by the mechanical system.

Fig. 2.1.1-8: Linear acceleration
Potential applications:

- Soft start (jolt reduction)
- Less risk of step losses
- Linear (constant) acceleration moment
- Maximum acceleration, in particular with flexible drive systems (belts)

### 2.1.1.3.7.3 $\sin ^{2 *} t$ Acceleration

The acceleration value progresses in accordance with a $\sin ^{2 *}$ t curve during the acceleration phases.
This minimizes the jolt experienced by the mechanical system. This reduces any remaining harmonic waves still present during linear acceleration.

Fig. 2.1.1-9: $\sin ^{2 *} t$ acceleration
Potential applications:

- Soft start (jolt reduction)
- Less risk of step losses
- Maximum acceleration, in particular with flexible drive systems (belts)

### 2.1.1.3.7.4 Adjustable acceleration

The acceleration and brake ramps can be adjusted individually.

Fig. 2.1.1-10: Adjustable acceleration
g067×28e
Possible application, e.g.:

- Defining if the acceleration must be done with or against additional external torques
- Asymmetric retaining forces of toolings (grippers)

The acceleration can be defined as

- Acceleration time
- Acceleration path or
- Acceleration (steps $/ \mathrm{s}^{2}$ )

Potential applications:

- Cycle-time dependent applications
- Simple path calculation
- Definition of acceleration torques

### 2.1.1.4 Current Control

The current is dependent on:

- Acceleration
- Constant speed
- Delay
- Stop (holding torque)

The current can be set as a $\%$ of the nominal value.
Values up to $150 \%$ are possible (boost)!

Fig. 2.1.1-11: Current control
g067x31e
Potential applications:

- Power loss limitation
- Torque control

### 2.1.1.5 Speed Control

The rotational speed is regulated by speed control. Achieving a specified position is not relevant here.

Potential applications:

- Simple interfaces for ready-made application programs
- Belt drives, conveyor systems

### 2.1.1.6 Camshaft Controller

The camshaft controller allows to set an output or bits in a position window. The position window can be defined absolutely or relatively:

- Set output/bit from Xn to Yn
- Set output/bit from Xn on for $\Delta \mathrm{Yn}$

Fig. 2.1.1-12: Camshaft controller
g067×32e
Potential applications:

- Setting of glue dots
- Length feeding
- Stamp positions
- Tool operation

### 2.1.1.7 Brake Control

Brake OFF (Output=1) $\Delta t$ Off before start of positioning.
Brake ON (Output=0) $\Delta t$ On before reaching target position.
If the brake was switched on, the execution of the next positioning is delayed by $\Delta$ tOff.

Fig. 2.1.1-13: Brake control
Potential applications:

- Lifting axis
- Parking brakes

### 2.1.1.8 Command Tables

In the command tables, a complex positioning sequence can be stored and executed independently according to the appropriate sequential list of individual commands.

The command sequence can be changed or stopped depending on external or internal (PLC) events.

The operating mode possibilities are:

- Cyclic (repeats after end of list)
- Event controlled (digital, analog, time)
- Direct addressing
- Skipping to other entries in list

Two tables are available that can alternately be switched over: An offline table (program run) and an online table (program up-/download).

Fig. 2.1.1-14: Command tables
Potential applications:

- Relieving the PLC
- Reduction of response times
- Encapsulating the application

## 3 750-672 [Stepper controller]

The intelligent 750-672 stepper controller has an on-board power driver designed to control 2-phase stepper motors up to $70 \mathrm{~V} / 7.5 \mathrm{~A}$.
The 64 times microstepping prevents step losses due to resonance in the acceleration phases and prevents excessive wear on mechanical parts. Adjustable current limits for stop, acceleration and constant speed help minimize motor power dissipation.

Six configurable inputs for start/stop, end-stop, reference, jog/tip, etc., can be directly processed by the internal software without delay.

Two outputs can be linked with internal functions or used freely.
Versatile functions, such as positioning with different acceleration slopes, command tables, camshaft controller, auto referencing and other eventdependent properties provide this controller with a wide spectrum of possible uses

The programmer's interface is the same for all WAGO stepper controller modules.

Various applications are implemented in the 750-672 stepper controller.

- Positioning,
- Speed Control

WAGO-I/O-SYSTEM 750
I/O Modules

Fig. 2.1.1-1: Stepper controller applications and operating modes
There are five operating modes available in each of the applications Positioning and Velocity Control:

- Positioning/speed parameter
- Referencing,
- Jog Mode,
- Move command via Mailbox,
- Run program.

The stepper controller function is defined by various tables, with the configuration table and the Bit I/O table playing a particularly important role.

Fig. 2.1.1-2: Tables in the stepper controller
The stepper module has six digital 24 V inputs: DI $1+$ and DI $6+$. The inputs are electrically isolated, and each has the reference potential DI 1through DI 6-.
This allows sensors and switches to be connected in two transmission systems.
In the standard application, the inputs have the following meaning:
DI 1 Enable input
DI 2 Reference input
DI 3 Jogging in positive direction
DI 4 Jogging in negative direction
DI 5 Limit switch in positive direction has been actuated
DI 6 Limit switch in negative direction has been actuated
For particular applications, other function can be assigned to these inputs.
The positive switching outputs DO 1 and DO 2 are short-circuit proof and can be loaded with up to 0.5 A .

In the standard application, the outputs have the following meaning:
DO 1 Target position has been reached
DO 2 An error has occurred
For particular applications, other function can be assigned to these outputs.
Corresponding entries in the configuration table refer to the bit table, which contains all internal function-relevant bits.

In addition, the stepper module has connections for motor windings.
The windings are connected to the contacts $M_{-} 1 A-M \_1 B$ and $M \_2 A-M \_2 B$.

Fig. 2.1.1-3: Stepper controller connections
g067205e
Connecting in series is required if the nominal current of a part winding is smaller than the medium operating current.
Otherwise, the motor windings should be switched parallel.
Faulty operating states, such as a short circuit in the motor windings or overheating in the output stage, are detected and signaled.

WAGO shielding clamping brackets must be used to connect the shielding of the motor circuit to the rail.

LEDs signal both the signal state of the digital inputs and outputs and the state of the voltage supply.
Four additional LEDs display the module's operating mode.
Field and system levels are electrically isolated.
Individual I/O modules can be arranged in any combination when configuring the fieldbus node. An arrangement in groups is not necessary.

A 24 V voltage supply is required to supply power to the internal logic. This voltage supply shares the same ground as the UDC motor voltage.

The UDC motor voltage is not protected against reverse polarity. WAGO Series 281 and 282 fuse terminals are available for fuse protection.

## Note

Only operate the module with 24 V DC PELV (Protective Extra Low Voltage) or SELV (Safety Extra Low Voltage) power sources. Using a higher voltage (motor voltages up to 70 V ) puts you at risk of electric shock.

The stepper controller can be operated at the following WAGO I/O SYSTEM 750 couplers and controllers:

| Bus system | Coupler/Controller | Item No. | Hardware vers. | Software vers. | Max. <br> number <br> of modules |

Other couplers/controllers upon request

## Note

The following must be observed when using the stepper module with CANopen bus couplers 750-337, 750-338, 750-837, 750-838, 750-347 and 750-348:
In the default configuration the stepper module data are mapped in consecutive PDOs. Each PDO can take up eight bytes of data. The 12-byte process image for the stepper module contains 2 PDOs, one with 8 and one with 4 bytes.

## Problem:

The specified and actual values for the positioning data is distributed among 2 PDOs during positioning using the cycling process image, which could result in the data not being transferred consistently.

## Remedy:

- For positioning via Mailbox mode, the mailbox data is consistently transferred in PDO1 and the control bits in PDO2.
- Use of 16-bit specified/actual values
or
- Omission of "on-the-fly" specified/actual values; i.e., initiation of the function only after setting of the specified values or reading out of the 24-bit actual values has been fully completed and only in the "Standstill" status.

### 3.6.1 Derating

In continuous operation, 5 A of motor current up to $50^{\circ} \mathrm{C}$ is possible. Derating above $50^{\circ} \mathrm{C}$ is 0.1 A per Kelvin.

Fig. 3.6.1-1: Derating curve in continuous operation with ventilator
g067221e

### 3.6.2 Specification of Current

### 3.6.2.1 Setting Motor Nominal Current

The vertex of the motor current can be defined via the configuration parameter Current at a resolution of 0.1 A .

### 3.6.2.2 Specification of Current Profile

The motor current can be set separately for the various motion phases.

- Standstill
- Acceleration
- Motion at constant speed
- Delay

The motor current is defined relatively to the motor nominal current; values between $0 \%$ and $150 \%$ are possible.

The module can supply a current of $150 \%$ of the module's nominal current for a limited time of up to 10 seconds.

To protect the module, a simplified thermal model is calculated for monitoring purposes. For this, the overcurrent is integrated when threshold value $150 \%$ * 10 s is reached, is turned off with an error message.

A lower overcurrent ( $\mathrm{I}_{\mathrm{OV}}$ ) can be supplied by the module for a correspondingly longer time. The time until deactivation ( $\mathrm{t}_{\text {off }}$ ) results from the following correlation:
$t_{\text {off }}=\frac{5 A}{I_{O V}-5 A} * 5 \mathrm{~s}$
After operation with overcurrent $\mathrm{I}_{\mathrm{OV}}\left(\right.$ time $\left.\mathrm{t}_{\mathrm{OV}}\right)$, a phase with reduced current $\mathrm{I}_{\mathrm{re}}$ (time $\mathrm{t}_{\mathrm{re}}$ ) must follow, in order for the module's thermal model to return to its original state. The required cooling time ( $\mathrm{t}_{\text {cool }}$ ) is calculated as follows:

$$
t_{c o o l}=4 * \frac{I_{O V}-5 A}{5 A-I_{r e}} * t_{O V}
$$

The prior overcurrent load can be retrieved in the internal status variables 21 . If overcurrent is present, the variable increases to 254 ; if no overcurrent is present, the variable returns to zero. When 255 is reached, the error message \#1413 PARTMODL_CURRENT_TIME is issued.

### 3.7 Process Image

The 750-672 I/O module provides the fieldbus coupler/controller 12 bytes input and output process image via 1 logical channel. The data to be sent and received are stored in up to 7 output bytes (D0 ... D6) and 7 input bytes (D0 ... D6), depending on the operating mode. Output byte D0 and input byte D0 are reserved and have no function assigned. $1 \mathrm{I} / \mathrm{O}$ module control and status byte (C0, S0) and 3 application control and status bytes (C1 ... C3, S1 ... S3) provide the control of the data flow.

## Note

Mapping the process data of some I/O modules (or their variations) into the process image is specific to the fieldbus coupler/controller used. This information, as well as the specific configuration for relevant control/status bytes is located in the section "Fieldbus-Specific Configuration of Process Data." This section describes the process image of the particular coupler/controller.

### 3.7.1 Overview

A basic distinction is drawn between the cyclic process image and the mailbox process image.

|  | Mailbox process image (Mailbox activated) |  | Cyclic process image (Mailbox deactivated) |  |
| :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { Off- } \\ & \text { set } \end{aligned}$ | Input data | Output data | Output data | Input data |
| 0 | Status byte S0 | Control byte C0 | Status byte S0 | Control byte C0 |
| 1 | Reserved | Reserved | Reserved | Reserved |
| 2 | Process dataD0 ... D6 | Process dataD0 ... D6 | $\begin{gathered} \text { Mailbox } \\ \text { MB0 ... MB5 } \end{gathered}$ | $\begin{gathered} \text { Mailbox } \\ \text { MB0 ... MB5 } \end{gathered}$ |
| 3 |  |  |  |  |
| 4 |  |  |  |  |
| 5 |  |  |  |  |
| 6 |  |  |  |  |
| 7 |  |  |  |  |
| 8 |  |  | Reserved | Reserved |
| 9 | Status byte S3 | Control byte C3 | Status byte S3 | Control byte C3 |
| 10 | Status byte S2 | Control byte C2 | Status byte S2 | Control byte C2 |
| 11 | Status byte S1 | Control byte C1 | Status byte S1 | Control byte C1 |

Switching between the two process images is conducted through bit 5 in the control byte ( C 0 (C0.5). Activation of the mailbox is acknowledged by bit 5 of the status byte $\mathrm{S} 0(\mathrm{~S} 0.5)$.

### 3.7.3 Cyclic Process Image

The process image appears as follows when the mailbox is deactivated (C0.5 = 0):

| Off- <br> set | Input data |  | Output data |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | S0 | Status byte S0 | C0 | Control byte C0 |  |
| 1 | Reserved |  |  | Reserved |  |
| 2 | D0 | Process Data | D0 | Process Data |  |
| 3 | D1 | Process Data | D1 | Process Data |  |
| 4 | D2 | Process Data | D2 | Process Data |  |
| 5 | D3 | Process Data | D3 | Process Data |  |
| 6 | D4 | Process Data | D4 | Process Data |  |
| 7 | D5 | Process Data | D5 | Process Data |  |
| 8 | D6 | Process Data | D6 | Process Data |  |
| 9 | S3 | Status byte S3 | C3 | Control byte C3 |  |
| 10 | S2 | Status byte S2 | C2 | Control byte C2 |  |
| 11 | S1 | Status byte S1 | C1 | Control byte C1 |  |

The configuration of the process data depends on the set operating mode; this is described in the associated sections.

A basic distinction is drawn between the following process images:

- Positioning,
- Jogging,
- Run program,
- Speed setting.

### 3.7.4 Process Image Mailbox

The process image appears as follows when the mailbox is activated (C0.5 = 1):

| Off- <br> set | Input data |  | Output data |  |
| :---: | :---: | :---: | :---: | :---: |
| 0 | S0 | Status byte S0 | C0 | Control byte C0 |
| 1 | Reserved |  | Reserved |  |
| 2 | MB0 | Opcode | MB0 | Opcode |
| 3 | MB1 | Status_Mbx | MB1 | Control_Mbx |
| 4 | MB2 | Reply <br> Parameter byte 1 | MB2 | Request <br> Parameter byte 1 |
| 5 | MB3 | Reply <br> Parameter byte 2 | MB3 | Request <br> Parameter byte 2 |
| 6 | MB4 | Reply <br> Parameter byte 3 | MB4 | Request <br> Parameter byte 3 |
| 7 | MB5 | Reply <br> Parameter byte 4 | MB5 | Request <br> Parameter byte 4 |
| 8 |  | Reserved |  | Reserved |
| 9 | S3 | Status byte S3 | C3 | Control byte C3 |
| 10 | S2 | Status byte S2 | C2 | Control byte C2 |
| 11 | S1 | Status byte S1 | C1 | Control byte C1 |

The individual applications can be set using opcodes.
The opcodes are assigned to various topical areas. They are described in the following chapters.

The control byte and status byte for the mailbox have the following function:

| Control_MBX |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| Toggle <br> flag | 0 | 0 | 0 | 0 | 0 | 0 | 0 | | Toggle flag |
| :--- |
| 0 |

| Status_Mbx |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| Toggle <br> flag | Return-Code |  |  |  |  |  |  |
| Return-Code | The return code indicates whether the last command was executed without error. If so, a <br> value of 0 is returned. When the return code provides a value other than 0, you must check <br> the corresponding opcode. <br> If the state of the toggle flag differs in the Control_MBX, the mailbox is read out. <br> Subsequently, the state of the bit is changed. |  |  |  |  |  |  |
| Toggle flag |  |  |  |  |  |  |  |

### 3.8 Mailbox Operation

The mailbox considerably expands the range of application.
The mailbox is activated when bit 5 of the control byte C 0 is set to 1 .
Activation of the mailbox is acknowledged by bit 5 of the status byte S 0 .

## Note

Mailbox mode is not automatically selected when the mailbox is activated in the coupler/controller! Bit 7 of control byte C 1 must be set to 1 for this.

### 3.9 Table Manager

Access to the tables is handled using the Table Manager. Possible table types are:

- Run programs,
- Positioning of camshaft,
- Target positions,
- Configuration,
- Data recorder.

Several tables of one table type may be present at different memory locations. The storage location is addresses using an index.

| Index | Storage location |
| :--- | :--- |
| $0:$ | not available / no table active / Factory Default for configuration / EEPROM |
| $1:$ | RAM 1 |
| $2:$ | RAM 2 |

Exceptions are: Configuration and the data recorder use RAM1 exclusively. The data from the data recorder can not be copied to the EEPROM.

One table of each table type may be activated and written when in motion mode.

WAGO-I/O-SYSTEM 750
I/O Modules

Of each table type, one table can be saved to the EEPROM. Tables in EEPROM cannot be activated, but only copied to a RAM table. If a table is present in the EEPROM, it will be copied automatically to RAM1 and RAM2 following a reset and is activated such that it can be directly executed in RAM1.

The tables are loaded via a download from the control. The following rules apply for a download:

- A download is always conducted only into one table in the RAM.
- A download is only permitted, when the target table is inactive.

The download is verified for consistency using a checksum. If the checksum is incorrect, the loaded table is marked as invalid.

Tables may be copied. The following rules apply to the copying of tables:

- The target table must be empty. Tables in RAM can be deleted using the command TBL_ERA.
- A copy is only permitted, when the target table is inactive.

The Table Manager detects whether a table is blank, valid or invalid (for example during a download or after a faulted download). This information is saved for each table in a status byte:

Access to a table (except configuration), even from other program modules, can be performed only via the table manager. Depending on the table type, several options are available for access:

- Downloading of a table,
- Copying of a table,
- Deleting one or more tables,
- Activating a table,
- Writing / Teaching of an element (position table only).

The position table saves target positions which can be queried using special commands. This position table enables target positions to be edited and taught, without having to change the Run program.

The table for camshaft saves a bit pattern, which is output depending on the position. The activation of a different table for the camshaft is executed immediately.

The table for the configuration saves a data fields, containing configuration data.

### 3.9.1 Download

Table download is performed to implement a transport layer for transferring relatively large data volumes via the I/O bus.
The transferred data blocks are fragmented into 4-byte blocks, which are then transferred to the module at each I/O module cycle. These data bytes are embedded in the mailbox and can be transferred simultaneously with the process data, ensuring control over this process while also in this mode.

A download is basically broken down into 3 phases:

1. Preparation for download using the command DLD_START
2. Transfer of data using the command DLD_CONT
3. Completion of download using the command DLD_END.

These commands are elucidated in the appendix.

### 3.9.2 Control

After downloading of tables types:

- Run program
- Camshaft
- Position table
the tables, and the associated functions, must be enabled.
- The camshaft is always active after this.
- The Run program is active after this and can also be halted again, contrary to the camshaft.

These commands are elucidated in the appendix.

### 3.10 Configuration

The response of the stepper module is essentially determined by the settings in the configuration table. The configuration table is broken down into several sectors:

| Addresses | Meaning |
| :--- | :--- |
| $0 \ldots 127$ | Direct parameters (basic) |
| $128 \ldots 223$ | Indicator table on source bits in the bit I/O table. <br> The indicator table can be used to change the permanent assignment of <br> internal and external function bits. <br> The address of the target bit is consistent with the address of the <br> configuration parameter. |
| $224 \ldots 376$ | Direct parameters (basic) |
| $380 \ldots 508$ | Direct parameters (extended) |

The bit I/O table is broken down into two sectors: Addresses 0 ... 127 describe the data sources; addresses 128 ... 255 described the targets to which the indicator can point.

Fig. 3.9.2-1: Configuration and bit I/O tables
g067230e

### 3.10.1 Configuration using Control Byte C2

The following values can be configured using the control byte C 2 in the standard configuration.

### 3.10.1.1 Frequency Prescaler

The values for the frequency prescaler (Freq_Prescaler) are determined by the bits Freq_Range_Sel in control byte 2 (C2.0 and C2.1). If both of these bits are zero ( 0 ), the value for the parameter Freq_Div in the configuration table is used.

| Freq_Range_Sel | '00' | '01' | '10' | '11' |
| :--- | :--- | :--- | :--- | :--- |
| Freq_Prescaler <br> (frequency prescaler) | Freq_Div $<>0:$ <br> Parameter Freq_Div from <br> configuration table <br> Freq_Div $=0:$ <br> 200 | 80 | 20 | 4 |
| $\mathrm{f}_{\mathrm{p}, \text { max }}$ | Freq_Div $<>0:$ <br> 2 MHz/Freq_Div <br> Freq_Div $=0:$ <br> 10 kHz | 25 kHz | 100 kHz | 500 kHz |

## Note

If Freq_Range_Sel $=0$ and configuration parameter Freq_Div $=0$, the variable Freq_Prescaler is set to 200.

The run speed is determined by the pulse frequency $\left(f_{p}\right)$, which is determined by the output data Velocity (D0 and D1) and by the prescaler Freq_Prescaler.

$$
f p=\frac{\text { Velocity } * 80}{\text { Freq_Prescaler }[\mathrm{Hz}]}
$$

The acceptable velocity range is $1 \ldots 25000$. The setting for the pulse frequency in [Hz] is given by selecting Freq_Prescaler $=80$.

## Note

The bits Freq_Range_Sel may only be modified when the control system is deactivated! These bits are therefore only accepted when Enable is not set.

WAGO-I/O-SYSTEM 750
I/O Modules

Correlation between the internal pulse frequency and the mechanical rotational speed at the motor axis.
$f_{m}=\frac{1}{p} * \frac{f_{p}}{256}$
$\mathrm{f}_{\mathrm{m}}$ Rotational speed at the motor axis revolutions per second
p Number of pole pairs
$\mathrm{f}_{\mathrm{p}}$ Internal pulse frequency
Correlation between the internal acceleration and the mechanical acceleration
$a_{m}=\frac{1}{p} * \frac{a}{256}$
$\mathrm{a}_{\mathrm{m}}$ Acceleration
p Number of pole pairs
a Internal acceleration

### 3.10.1.2 Acceleration Factor

The value for the acceleration factor (Acc_Multiplier) is determined by the bits Acc_Range_Sel in control byte 2 (C2.2 and C2.3). If both of these bits are zero (0), the value for the parameter Acc_Fact in the configuration table is used.

| Acc_Range_Sel | '00' | '01' | $\prime 10^{\prime}$ | '11' |
| :--- | :--- | :--- | :--- | :--- |
| Acc_Multiplier <br> (acceleration factor) | Acc_Fact <>0: <br> Parameter Acc_Fact from <br> configuration table <br> Acc_Fact = 0: <br> 8 | 80 | 800 | 8000 |
| Acceleration period T to f <br> max <br> at max. acceleration 32767 | Acc_Fact <> 0: <br> Setting from <br> configuration | 760 ms |  |  |
| Acc_Fact = 0: <br> 7600 ms | 76 ms | 0.2 ms |  |  |

## Note

If Acc_Range_Sel = 0 and configuration parameter Acc_Fact $=0$, the variable Acc_Multiplier is set to 8 .

Acceleration is determined by the output data Acceleration (D2 and D3) and the prescaler Freq_Prescaler and by the acceleration factor Acc_Multiplier.

$$
a=\text { Acceleration } * \frac{\text { Acc_Multiplier }}{\text { Freq_Prescaler }\left[\frac{H z}{s}\right]}
$$

The permissible acceleration range is $1 \ldots 32767$.
Acceleration is set in $[\mathrm{Hz} / \mathrm{s}]$ when the acceleration factor Acc_Multiplier is selected equal to the prescaler Freq_Prescaler.

## Note

The bits Acc_Range_Sel may only be modified when the control system is deactivated! These bits are therefore only accepted when Enable is not set.

### 3.10.2 Configuration via Mailbox

## Configuration Table

All parameters for configuring the servo stepper controller are in the configuration table.

The table below shows an excerpt from the configuration table.

| Configuration <br> variable | Offset <br> (Dec.): | Bit <br> Offs. <br> $:$ | Data <br> type: | Default: | Range: | Description |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| User_Conf_Id | 0 |  | UINT16 | 0 | $0 \ldots 50000$ | The dataset number can be freely <br> assigned by the user. Numbers above <br> 50000 are reserved. |
| ConfVersion | 2 |  | UINT8 | 4 | $0 \ldots . .254$ | Configuration version number |
| Application_ <br> Selector | 3 |  | UINT8 | 1 | $0 \ldots 2$ | Switching of the application The <br> appropriate process image is activated <br> when a new application is selected. |
| Freq_Div | 4 |  | UINT16 | 200 | $4 \ldots 65535$ | Sets the prescaler for the maximum <br> velocity |
| Acc_Fact | 6 |  | UINT16 | 80 | $1 \ldots 65535$ | Sets factor for maximum acceleration |

Access to the table is carried out via the mailbox.
All configuration parameters lie in the configuration data set.
The elements of the configuration data set are referenced via an address. The address results from the table assignment with configuration values. An element can occupy more than one byte, in which case the lowest value byte
occupies the given address. For explicit access to an element, the size of the element must be stated.

The table can be found in the appendix to chapter 4.6, „Configuration Variables".

The complete data set is loaded to the RAM on a download and is then saved to the EEPROM; a module warm start is then executed. The download is executed with the commands DLD_START, DLD_CONT and DLD_END. The commands are described in chapter 3.9, "Table Manager".

The writing procedure to the EEPROM is signaled by LED A.
The download is conducted by the table manager. The configuration dataset is saved to the EEPROM only after a successful download. Independent from the success of the download, a warm restart will be executed in any case.

The Reset status bit is set after the warm start; this must be canceled using the Reset_Quit control bit. Only then is the module operational again.

Alternatively, individual parameters can be modified target-oriented when the terminal is active.

This requires the diagnostics opcodes (see chapter 3.13, „

Diagnostics").
If a valid configuration data set is available in the EEPROM after power-on, reset or a warm start of the module, this data set is loaded to the RAM; if not, the factory default data set is loaded, i.e. the module is restored to the WAGO as-delivered status.

### 3.10.2.1 Configuration of Basic Parameters

### 3.10.2.1.1 Application Selection

Application_Selector, Offset 0, Range [0 ...5]

The Application_Selector determines the basic function:

| Value | Application |
| :--- | :--- |
| 0 | Reserved |
| 1 | Positioning controller |

### 3.10.2.1.2 Prescaler for Maximum Velocity

Freq_Div, Offset 4, Range [4 ...65335]

The maximum internal output frequency is derived from an internal 2 MHz cycle by a prescaler. When the smallest possible prescaler (4) is selected, a maximum internal frequency of $500,000 \mathrm{~Hz}$ is yielded. The stepper frequency is derived from this fundamental frequency (see chapter 4.1, "Calculation Formulas").

### 3.10.2.1.3 Factor for Maximum Acceleration

Acc_Fact, Offset 6, Range [1 ...65535]
Acceleration is given in steps $/ \mathbf{s}^{2}$. The specified value is multiplied by the acceleration factor (Acc_multiplier) and then divided by the frequency prescaler (Freq_Prescaler).
$a=$ Beschleunigungswert $* \frac{\text { Acc_multiplier }}{\text { Freq_Prescaler }}$
Acceleration value: Setting via process image, or parameter in an opcode.

### 3.10.2.1.4 Reference Run

Reference_Offset, Offset 108, Range [ $\pm$ 8388607]
Position of reference switch.

## Reference_Mode, Offset 112

Mode for referencing on start of a reference run using the control bit M_Reference. At the start of a reference run via the mailbox using the Move command START_REFERENCING, the call parameters are used (and NOT the following configuration bits).

| Bit $1:$ |  |
| :--- | :--- |
| $0:$ | Reference run to reference switch |
| 1: | Reference run to limit switch |
| Bit 2: |  |
| $0:$ | Reference run to negative end of a reference switch |
| 1: | Reference run to positive end of a reference switch |
| Bits $3 \ldots 7:$ Reserved |  |

### 3.10.2.1.5 JogMode

Acc_Fact, Offset 44, Range [1 ...25000]
Default setup speed.
The current moving speed is used when this parameter is 0 .
Acc_Fact, Offset 62, Range [0 ...32767]
Acceleration for JogMode and Referencing.

### 3.10.2.1.6 Ramps

Acceleration_Stop_Fast, Offset 46, Range [0 ...32767]
Default acceleration for STOP mode; the current acceleration is used when this parameter is 0 .

Acceleration_RampUp, Offset 48, Range [0 ...32767]
Default acceleration for acceleration phase.
Acceleration_RampDown, Offset 50, Range [0 ...32767]
Default acceleration for delay phase.
Acceleration_RampUp_Param, Offset 52, Range [0-16777216]16777216]

Default acceleration time or acceleration path
Acceleration_RampDown_Param, Offset 56, Range [0-16777216]16777216]

Default delay period or delay path.
Acceleration_Modes, Offset 60

|  | ... 1: AccType (acceleration type) |
| :---: | :---: |
| 0 : | constant acceleration |
| 1: | Linear rise in acceleration; the period for acceleration increase is Acceleration_RampUp_Param |
| 2 : | Sin2 rise in acceleration; the period for acceleration increase is Acceleration_RampUp_Param |
| 3: | Reserved |
| Bit 2 .. Bit 2-3: AccParam (Acceleration parameter) |  |
| 0 : | no modification |
| 1: | Acceleration_RampUp_Param interpreted as the acceleration period |
| 2. | Acceleration_RampUp_Param interpreted as the acceleration path |
| 3: | Reserved |
| Bits $4 . . .5$ : DecType (deceleration type) |  |
| 0 : | constant acceleration |
| 1 : | Linear rise in acceleration; the period for acceleration increase is Acceleration_RampUp_Param |
| 2 : | Sin $^{2}$ acceleration; the period for acceleration increase is Acceleration_RampUp_Param |
| 3: | Reserved |
| Bits 6 ... 7: DecParam (decelration parameter) |  |
| 0 : | no modification |
| 1: | Acceleration_RampUp_Param interpreted as the acceleration period |
| 2: | Acceleration_RampUp_Param interpreted as the acceleration path |
| 3: | Reserved |

### 3.10.2.1.7 Scaling Factors

Pos_Mult, Offset 20, Range [1 ... 65535]
Pos_Div, Offset 22, Range [1 ... 65535]
Scaling factors for position.
Speed_Mult, Offset 28, Range [1 ... 65535]
Speed_Div, Offset 30, Range [1 ... 65535]
Scaling factors for speed.
Acc_Mult, Offset 32, Range [1 ... Acc_Mult, Offset 32, Range [1-65535] Acc_Div, Offset 34, Range [1-65535]65535]

Scaling factors for acceleration.

### 3.10.2.1.8 Brake

Braketime_Turn_On, Offset 100, Range [1 ...8388607]
Activation time for brake in [ms].
Braketime_Turn_Off, Offset 104, Range [0 ...8388607]
Switch-off time for brake in [ms].

### 3.10.2.1.9 Hardware/Software Configuration

HwSwConfig, Offset 19

| Bits $0 \ldots 1:$ Reserved |  |
| :--- | :--- |
| Bit 2: Drive_Direction (Direction of rotation inversion) |  |
| $0:$ | Output signal is processed directly |
| $1:$ | Output signal: rotary direction is inverted |
| Bits $3 \ldots$... 6: Reserved |  |
| Bit $7:$ Program_Autostart (Run program Autostart - Normal mode) |  |
| $0:$ | Run program activated only via Run program or Mailbox mode. |
| $1:$ | Run program activated immediately after startup, see description. |

### 3.10.2.1.10 Current Controller

The current controller works in accordance with the hysteresis procedure, which is distinguished by the following characteristics:

- Relatively easy parameterization
- Regulation characteristics are nearly independent from the motor
- Robust performance without stability problems
- Very quick reaction
- Minimal switching loss

The preset two- or three-point controller regulates the motor current within the hysteresis band that is specified by the parameter Current_Ctrl_Hysteresis.

The hysteresis should not fall below 50 mA , since the measurement noise and the resolution would then become negatively apparent. The upper limit should not exceed $10 \%$ of the motor current. The switching frequency falls in the case of an increasing hysteresis and can then lie within the audible range. The upper maximum switching frequency lies at approximately 30 kHz and cannot be exceeded.

## Note

Due to the its architecture, readjusting the current controller is typically not necessary. Please contact WAGO Support.

Parameterizing the current controller:

| Addr <br> esses | Parameter | Range | Function |
| :--- | :--- | :--- | :--- |
| 384 | Currrent_Ctrl_Hyste <br> resis | $0 \ldots 5000$ | Current controller hysteresis: <br> The current controller hysteresis has the unit [mA]. <br> The parameter defines the width of the current <br> band. |
| 388 | Currrent_Ctrl_TZMi <br> n | $1 \ldots 65535$ | Current three-point controller only: <br>  <br> before switching band in [us * 4] |
| 392 | Currrent_Ctrl_TZMa <br> x | $1 \ldots 65535$ | Current three-point controller only: <br> Max. time after switching null pointer in [us * 4]. <br> The band will then be forced to switch <br> independently of the current. |
| 394 | Curr_Pass2 | $1 \ldots 65535$ | Password for current controller parameters: <br> EXOR link for parameters 384, 388, 392, 396 and <br> $0 x C O D E . ~ A ~ f a l s e ~ p a s s w o r d ~ w i l l ~ g e n e r a t e ~ a n ~ e r r o r ~$ |
| message. |  |  |  |$|$| Current controller type: |
| :--- |
| $0: \quad$ Three-point controller |
| $1: \quad$ Two-point controller |

### 3.10.3 Digital Signals and their Interconnection

The vital binary signals are addressed by central access functions. This permits easy, external access to all bits and allows linking of the bits to one another to be parameterized. Access to individual bits is performed using an index $0 \ldots 255$.

A bit function is defined by the function unit that sets the bit (source) and the function unit that reacts to this bit (target). Only the source is defined for output bits, and only the target for control bits. Only status bits have set links between two function units; they can, however, also be queries as output bits for further processing. Bits for which the source is not fixed are designated as linkable bits.

The universal filter functions FILT1 ... FILT8 possess a special status. The inputs for these filter functions are linkable bits that can be linked to any other bit. A query of these bits, on the other hand, provides information about the status of the filter. As a result, these bits represent a function between inputs and outputs.

The table containing the available bits is given in the appendix in chapter 4.5, „Bit Field for I/O Driver".

The following conventions apply:

- Source bits are assigned numbers 0 to 127 and may not be used as target bits. A source bit may reference several target bits.
- Target bits are assigned numbers 128 to 255 and may also be used as source bits. Target bits have exactly one source.
- References are stored in the configuration table. The names of the table entries correspond to those in the bit table. The prefix Ptr is placed in front of the identifier.
- The standard link between the source and target is entered in the column "Target/Source". This corresponds to the WAGO default settings (FACTORY_DEFAULT).

### 3.10.4 Linking of Bits

The expanded parameters are set using pointers (indices). The address for these pointers indicates a corresponding address in the bit I/O field. Allocation using names is also provided. "Ptr_nnn" indicates the variable "nnn".

Actual allocation is conducted using the content of the pointer.
The figure below illustrates allocation with an example of motor shutdown using Stop1_N and Stop2_N.

Fig. 3.10.4-1: Linking of bits
Index Ptr_Stop1_N has a value of 48 ( $0 x 30$ ), thus assigning Input1 to the Stop1_N variable.
Index Ptr_Stop2_N has a value of 65 ( $0 \times 41$ ), thus assigning control bit C1.1 to the Stop2_N variable.

The table excerpts given below show the corresponding entries for the configuration and bit I/O table.

| Configuration <br> Variable | Address |  | Data | Default <br> type <br> value | Range | Description |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | Dec. | Hex. |  |  |  |  |
| $\ldots$ |  |  |  |  |  |  |
| Ptr_Stop2_N | 177 | $0 x B 1$ | UINT8 | $0 \times 41$ | $0 \ldots 255$ | Source for linkable bit 0xB1 |
| $\ldots$ |  |  |  |  |  |  |
| Ptr_Stop1_N | 194 | $0 x C 2$ | UINT8 | $0 \times 30$ | $0 \ldots 255$ | Source for linkable bit 0xC2 |
| $\ldots$ |  |  |  |  |  |  |

| Designation | Bit number |  | Type | Default allocation |  | Description |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Dec. | Hex. |  | Target/Sourc e | Bit no. |  |
| $\ldots$ |  |  |  |  |  |  |
| Input1 | 48 | 0x30 | SRC | $\begin{aligned} & \text { KBUS_ST3_0 } \\ & \text { Stop1_N } \end{aligned}$ | $\begin{aligned} & 0 \times 90 \\ & 0 \times 2 \end{aligned}$ | Input 1 |
| $\ldots$ |  |  |  |  |  |  |
| $\begin{aligned} & \text { KBUS_CTR } \\ & \text { L1_1 } \end{aligned}$ | 65 | 0x41 | SRC | Stop2_N | 0xB1 | Internal bus control byte 1 bit 1 |
| $\ldots$ |  |  |  |  |  |  |
| Stop2_N | 177 | 0xB1 | DST/ <br> SRC | $\begin{aligned} & \text { KBUS_CTRL } \\ & 1 \_1 \end{aligned}$ | 0x41 | Drive Stop 2 inverted |
| $\ldots$ |  |  |  |  |  |  |
| Stop1_N | 194 | 0xC2 | DST/ <br> SRC | Input1 | 0x30 | Drive Stop 1 inverted |
| $\ldots$ |  |  |  |  |  |  |

Linkable bits can be programmed for any source. This "linkability" enables flexible configuration and flexible arrangement of module terminal assignments. For example, the Start linkable bit can be set to the Input 1 fixed bit.

## Note

A linkable bit can be linked to another linkable bit, but the maximum number of nesting levels is four (4). Too many nesting levels will yield an ambiguous result and the error ERR_LINK_NESTING will be issued.

## Note

The nesting levels are not checked until the system run time.
The linking of bits occurs in the device configuration and is modifiable only by a reconfiguration. Exceptions are those bits which are linked to MZERO and MONE. Such bits can be freely set and reset during operation via mailbox commands or the run program.

Please see the following example for clarification:
Input 2 is normally set as the reference input. However, in a certain application is may be more advantageous to use Input 2 for specifying the direction of movement for the JogMode. Moreover, a "1" at the input should signify that the motor is moving in a positive direction.

The address and length of the configuration variables are given in the appendix in chapter 4.6, „Configuration Variables".

| Configuration <br> variable | Address |  | Data | Default <br> type | Ralue | Range |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

The bits required for this are given in the appendix in chapter 4.5, „Bit Field for I/O Driver".

| Designation | Bit number |  |  | Default allocation |  | Dec. |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | Hex. |  | Target/Sourc <br> e | Bit no. |  |  |

A prerequisite for this is that the mailbox has already been activated. This is described in chapter 3.8, "Mailbox Operation".

Using the above described procedures, the bits of control and status byte of the standard assignment can be modified.

## Warning

Any change to the standard configuration will invalidate the description given for the changed items.

Unused linkable bits may be linked to the constant bits ZERO or ONE.

### 3.10.4.1 Special bits ZERO, ONE, MZERO and MONE

The ZERO and ONE bits are fixed.
The ZERO bit is always deleted and has a value of 0 ; the ONE bit is always set and has a value of 1 .
Linkable bits can be set to a fixed value using ZERO and ONE bits.
The MZERO and MONE bits have the same function, but also possess an additional function when they are the source for linkable bits.
The source bit gives the status of linkable bits. As a result, linkable bits cannot be changed by commands or access functions. Exceptions to this rule are the linkable bits that are linked to MZERO and MONE.
A bit that is linked to MZERO is first deleted after a reset, but can be manipulated as required using the mailbox command or the Run program. A bit that is linked to MONE is initially set after a reset and is otherwise treated the same as a bit linked to MZERO.

### 3.10.4.2 User Bits

The following bits in the bit table are accessible to the user as marker bits:

| Designation | Bit number |  |
| :---: | :---: | :---: |
|  | Dec. | Hex. |
| UserBit_0 | 152 | 0x98 |
| UserBit_1 | 153 | $0 x 99$ |
| UserBit_2 | 154 | $0 x 9 \mathrm{~A}$ |
| UserBit_3 | 155 | 0x9B |
| UserBit_4 | 156 | 0x9C |
| UserBit_5 | 157 | 0x9D |
| UserBit_6 | 158 | 0x9E |
| UserBit_7 | 159 | 0x9F |

As an example, they can be reasonably implemented in a run program.

## Warning

The user bits can only be written when they are properly linked in the configuration table.

| Configuration Variable | Address |  |
| :---: | :---: | :---: |
|  |  | Dec. |
| Ptr_UserBit_0 | X | 152 |
| Ptr_UserBit_1 | X $\quad 99$ | 153 |
| Ptr_UserBit_2 | X $\quad 9 \mathrm{~A}$ | 154 |
| Ptr_UserBit_3 | X _ 9B | 155 |
| Ptr_UserBit_4 | X $\quad 9 \mathrm{C}$ | 156 |
| Ptr_UserBit_5 | X _ 9D | 157 |
| Ptr_UserBit_6 | X__9E | 158 |
| Ptr_UserBit_7 | X | 159 |

The bits are linked with the bit MZERO (2), which enables write access.

### 3.10.4.3 Filters, Low Pass, Timers and Counters

The filter is configured using the table with the configuration values (see chapter 4.6, „Configuration Variables").

Eight special bits are defined that can implement the following functions:

1. Inverting
2. Starting edge filter
3. Low pass
4. Pulse extension
5. Monoflop, not retriggerable
6. Pulse delay
7. Math
8. Counter, up
9. Counter, up, stop at overrun
10. Counter, down
11. Counter, down, stop at overrun.

The functions inversion and starting edge filter react to the linkable input bit and trigger the output undelayed.

The functions low pass, impulse extension, monoflop and pulse delay react to the linkable input bit and trigger the output according to the selected function with a definable time constant. This time can be set between $0 \ldots 16777215$ ms.

Fig. 3.10.4-2: Inverting
A starting edge filter recognizes to states. After a reset, the filter is in wait state as long as the input is active. The output supplies 0 . As soon as the input signal is Zero for the first time, the filter changes to operating mode and the input signal is passed unchanged to the output. An operational change back to the wait state is not intended.

Fig. 3.10.4-3: Starting edge filter
The Low pass does not accept any change of the input signal until the new status is constant during the runtime.

Fig. 3.10.4-4: Low pass 500 ms
The impulse expansion sets the output at a $0 \rightarrow 1$ edge of the input.. The output is reset when the time set has passed after the $1 \rightarrow 0$ edge.. A re-triggering during the runtime is possible.

Fig. 3.10.4-5: Pulse extension 500 ms
The monoflop function sets the output at a $0 \rightarrow 1$ edge of the input. After the set time has passed, the output is reset.. A re-triggering during the runtime is not possible.

Fig. 3.10.4-6: Monoflop 500 ms cannot be retriggered with short input pulse

Fig. 3.10.4-7: Monoflop 500 ms cannot be retriggered with long input pulse
Pulse extension sets the output when the set time has expired after an input $0 \rightarrow 1$ edge. The output is reset as soon as the input is deactivated. The output is not reset if the input is deactivated before the set time expires.

Fig. 3.10.4-8: Pulse delay 500 ms

Application example: filters connected in series: Monoflop 500 ms , inverting and a second monoflop 100 ms .

Fig. 3.10.4-9: Filters connected in series: Monoflop 500 ms , Inverting and second monoflop 100 ms

The math function reacts independently of the input bit. This value can only be set, incremented or decremented using commands. These commands can be transferred in the mode "Mailbox Move command," or processed as a component of the downloaded program in the mode "Program mode." The output is set when the counter has a value other than zero and is reset when the filter reaches zero. The commands for modifying the filter can only be used in the function "Math" or "Counters."

In the mode "Counter, up"/"Counter, down" the filter value is raised or lowered by one for each $0 \rightarrow 1$ edge of the filter input. The maximum counting frequency for external signals is 1 kHz ; internal signals are normally evaluated once per program cycle.

The mode "Counter, up, stop" / "Counter, down, stop" behaves in the same manner as "Counter, up" / "Counter, down", except that counting is halted when the filter value reaches zero. This however means that the filter value must be preloaded with a starting value unequal to Zero, from which it counts towards Zero.

### 3.10.5 Run Commands

The commands are divided in classes:

- Table commands
- Run commands
- Auxiliary commands

In addition to pure Move commands, auxiliary commands and table commands are also accepted. The Move commands are passed along to the command interpreter. The table commands and auxiliary commands are required exclusively for the Run program mode.

A process is started using Move commands; there is no waiting for the end of the process (such as reaching a target).

Most commands are processed immediately, with the following exceptions.
Motion commands are only started when the previous motion command has arrived at the target. Table processing is interrupted in this case until the target is reached.

An exception here are the direct Move commands _IMM (immediate), which discontinue the Move command currently in progress and are directly processed.

Commands waiting for an event are repeated until the event has occurred.
The Move command manager decides from which source the Move commands are to be accepted. Possible sources may be:

- Status control,
- Limit switches,
- Run commands via mailbox commands,
- Positioning,
- Referencing,
- JogMode,
- Program mode.

Condition control and limit switches are processed in priority; they can only execute commands to brake the drive. The selection of the corresponding operating mode switches between the other setpoint values.

A run program serves in the consecutive execution of individual motions. In addition, some values can be set via the run program.

Two options are available for the processing of a run program:

- Program operation:

The individual commands are collated and loaded to the terminal via download. The run program can then be executed there through the Program mode (see chapter 3.11.1.7, „Run Program Operating Mode").

- Run task via mailbox:

The module can be operated via mailbox using the move commands. Movement can be made directly to different positions. This command is accepted only when the mode "Move task via mailbox"(chapter 3.11.2, "Move Mode via Mailbox") has been activated.

Each individual step in the Run program has the following format:

| Byte | Meaning |
| :--- | :--- |
| 1 | Command |
| 2 | Data 1 |
| 3 | Data 2 |
| 4 | Data 3 |

The individual commands are elucidated in the appendix in chapter 4.3, „Commands for Move Mode".

### 3.10.6 Scaling, Number Ranges and Units

Stepper drives rotate at a defined angle on each pulse. The software is oriented to this impulse output; accordingly, the internal unit for the position is a "step". Velocity and acceleration are derived form this. The interface enables adaptation and conversion to application-specific units (path in $\mathrm{m}, \mathrm{mm}$, degrees, and velocities in $\mathrm{m} / \mathrm{s}$, degrees $/ \mathrm{s}$ ).

### 3.10.6.1 Internal Measuring Unit

### 3.10.6.1.1 Time

On account of the periodical processing employed, time is measured in TICKS, with a TICK being the duration of one scan interval. A TICK is equal to one millisecond. Physical units based on time are converted accordingly.

### 3.10.6.1.2 Path

The travel, or path, is measured in "steps". The number range is 24 bits, including sign.

Position range: -8388608-+8388607, Presentation in two's complement.

Correlation between the position specification in the process data and the rotor bearing on the motor axis.
$\varphi=360^{\circ} * \frac{s}{64 * N}$
$\varphi \quad\left[{ }^{\circ}\right]$ Rotor bearing, axis angle
s [1] Setpoint position in process image
N [1] Number of full steps

### 3.10.6.1.3 Velocity

Velocity is measured in "steps per unit of time", with the range being $\pm 15$ bits.
Velocity range:
Velocity $_{\min } \ldots$ Velocity $_{\max }=-25000 \ldots+25000$

### 3.10.6.1.4 Rotational Speed

### 3.10.6.1.4.1 Calculation via Internal Pulse Frequency

Correlation between velocity specification in the process data and internal pulse frequency

$$
f_{p}=\frac{\text { Speed_Mult }}{\text { Speed_Div }} * \frac{80 * v}{\text { Freq_Div }}
$$

| $\mathrm{f}_{\mathrm{p}}[1 / \mathrm{s}]$ | Internal pulse frequency in increments per second ${ }^{\wedge}$ 2 |
| :--- | :--- |
| $\mathrm{v}[1]$ | Setpoint velocity in process image <br> Speed_Mult <br> Scaling factor for setpoint velocity <br> (parameter 28 from configuration table) |
| Speed_Div | Scaling factor for setpoint velocity <br> (parameter 30 from configuration table) |
| Freq_Div | Prescaler for maximum velocity <br> (parameter 4 from configuration table) |

Correlation between the internal pulse frequency and the mechanical rotational speed at the motor axis
$f_{m}=\frac{1}{p} * \frac{f_{p}}{256}$
$f_{p}$ [1/s] Internal pulse frequency in increments per second ${ }^{\wedge} 2$
$\mathrm{f}_{\mathrm{m}}[1 / \mathrm{s}]$ Rotational speed at motor axis in revolutions per second
p [1] Number of pole pairs
v [1] Setpoint speed in process image

### 3.10.6.1.4.2 Direct Calculation

Correlation between velocity specification in the process data and mechanical rotational speed at the motor axis

$$
\begin{aligned}
& f_{m}=\frac{1}{p} * \frac{\text { Speed_Mult }}{\text { Speed_Div }} * \frac{v}{3,3 * \text { Freq_Div }} \\
& n_{m}=60 * f_{m}
\end{aligned}
$$

$$
\mathrm{f}_{\mathrm{p}}[1 / \mathrm{s}] \quad \text { Internal pulse frequency in increments per second }{ }^{\wedge} 2
$$

$$
\mathrm{f}_{\mathrm{m}}[1 / \mathrm{s}] \quad \text { Rotational speed at motor axis in revolutions per second }
$$

$$
\mathrm{n}_{\mathrm{m}}[1 / \mathrm{min}] \quad \text { Rotational speed at motor axis in revolutions per minute }
$$

$$
\mathrm{p}[1] \quad \text { Number of pole pairs }
$$

$$
\mathrm{v} \text { [1] Setpoint velocity in process image }
$$

Speed_Mult Scaling factor in process image

$$
\text { (parameter } 28 \text { from configuration table) }
$$

Speed_Div Scaling factor for setpoint velocity

$$
\text { (parameter } 30 \text { from configuration table) }
$$

$$
\text { Freq_Div } \quad \text { Prescaler for maximum velocity }
$$

$$
\text { (parameter } 4 \text { from configuration table) }
$$

These values can also be specified and defined with user-specific units. For this, the specified data for speed is multiplied by a factor Speed_Mult prior to internal processing and then divided by a factor Speed_Div. If the internal $\rightarrow$ external or external $\rightarrow$ internal conversion violates the permissible value range, error message 1513 (UNITS_SPEED_INT_RESULT) or 1514 (UNITS_SPEED_USER_RESULT) will be īissued.

### 3.10.6.1.5 Acceleration

Correlation between internal acceleration and specification in the process data

| $a=\frac{\text { Acc_Mult }}{\text { Acc_Div }} * \frac{\text { Acc_Fac }}{\text { Freq_Div }} *$ Acceleration |  |
| :--- | :--- |
| a | Internal acceleration |
| Acc_Mult | Scaling factor for setpoint acceleration <br> (parameter 32 from configuration table) |
| Acc_Div | Scaling factor for setpoint acceleration <br> (parameter 34 from configuration table) |
| Acc_Fac | Factor for maximum acceleration <br> (parameter 6 from configuration table) <br> Prescaler for maximum velocity <br> (parameter 4 from configuration table) |
| Freq_Div | Setpoint acceleration |

Correlation between the internal acceleration and the mechanical acceleration

$$
a_{m}=\frac{1}{p} * \frac{a}{256}
$$

$\mathrm{a}_{\mathrm{m}}\left[1 / \mathrm{s}^{\wedge} 2\right] \quad$ Acceleration at motor axis in revolutions per second ${ }^{\wedge} 2$
p [1] Number of pole pairs
a Internal acceleration
These values can also be specified and defined with user-specific units. For this, the specified data for acceleration is multiplied by a factor Acc_Mult prior to internal processing and then divided by a factor Acc_Div. If the internal $\rightarrow$ external or external $\rightarrow$ internal conversion violates the permissible value range, error message 1515 (UNITS_ACC_INT_RESULT) or 1516 (UNITS_ACC_USER_RESULT) will be issued.

### 3.10.6.2 External Measuring Units

Internal representation can also be converted to application-specific units using conversion factors. Conversion is performed by muliplying by a configurable factor (*_MULT) and then dividing by a configurable factor (*_DIV). This way, fractions can be set with high accuracy within a wide range. These factors are expalined in greater detail in the following sections.

### 3.10.6.2.1 Path

The setting data for the positions are multiplied by the configuration factor Pos_Mult prior to internal processing and then divided by the configuration factor Pos_Div.

For example, is a step (or microstep) corresponds to travel of 0.12 mm , the setting can be given in $\mu \mathrm{m}$ by selecting Pos_Mult = 1 and Pos_Div $=120$, or in mm by selecting Pos_Mult $=25$ and Pos_Div $=3$.

If the internal $\rightarrow$ external or external $\rightarrow$ internal conversion violates the permissible value range, error message 1511 (UNITS_POS_INT_RESULT) or 1516 (UNITS_POS_USER_RESULT) will be issued.

### 3.10.6.2.2 Velocity

The setting data for velocity are multiplied by the configuration factor Speed_Mult prior to internal processing and then divided by the configuration factor SPEED_DIV and the prescaler Freq_Prescaler.

If the internal $\rightarrow$ external or external $\rightarrow$ internal conversion violates the permissible value range, error message
1513 (UNITS_SPEED_INT_RESULT) or
1514 (UNITS_SPEED_USER_RESULT) will be issued.

### 3.10.6.2.3 Acceleration

The setting data for acceleration are multiplied by the configuration factor Acc_Mult prior to internal processing and then divided by the configuration factor Acc_Div.

If the internal $\rightarrow$ external or external $\rightarrow$ internal conversion violates the permissible value range, error message 1515 (UNITS_ACC_INT_RESULT) or 1516 (UNITS_ACC_USER_RESULT) will be issued.

### 3.11 Operating Modes

### 3.11.1 Operation via Cyclic Process Image

Various operating modes are available in the stepper controllers. They are described in the following chapters.

An operating mode is selected using the Command[0...5] mode selection bits in the cyclic process image

### 3.11.1.1 Selecting an Operating Mode

A mode can only be selected when the module is ready for operation and no other mode is active. This is the case when the status bits Ready and Stop_N_ACK are active and Start_ACK and Start are not active. If these conditions is not fulfilled but a Command[0...5] mode selection bit is still set, mode selection is delayed until this condition is fulfilled.
This delay ensures that any tasks in progress are ended properly.
An operating mode is selected by setting the assigned mode selection bit. If an operating mode is already active, setting another mode selection bit has no function, and the old operating mode is maintained.

The selection of an operating mode is acknowledged by the assigned operating mode status bit *_ACK.

### 3.11.1.2 Exiting an Operating Mode

An operating mode is exited by deleting the assigned mode selection bit. If the drive is still in motion, it is then braked at the acceleration Acceleration_Stop_Fast. The assigned mode status bit will not be canceled until the drive comes to a standstill.

The Standstill status bit is set when the drive is motionless.
A mode is also ended when Stop_N_ACK is reset. If the drive is still in motion, it is then braked at the acceleration Acceleration_Stop_Fast. The assigned mode status bit will not be canceled until the drive comes to a standstill.

A mode is also ended when Ready is reset. Independent from the drive condition, the speed is immediately set to Zero. The assigned operating mode status bit is cleared immediately. This procedure poses loss of control over the drive, allowing the motor to run down in an uncontrolled manner particularly at loads with high moments of inertia. This is usually combined with step loss, and a reference motion should be initiated subsequently.

### 3.11.1.3 Sequence Diagram for Selection and Ending of Modes

Fig. 3.11.1-1: Sequence diagram for Positioning

*) Linked to DI 1 in the standard configuration.

### 3.11.1.4 Single Positioning Operating Mode

The single positioning operating mode is only possible when the mailbox is deactivated.

The mode must first be activated using Command[] $=1$. When bit Command_ACK[] $=1$ is set, the singe positioning mode is active. The following setpoints can then be specified:

- Velocity,
- Acceleration,
- Absolute position.

The permissible velocity range is $1 \ldots 25000$. A velocity equal to 0 , velocities greater than 25000 and negative velocities are not permitted and will result in an error message.

The permissible acceleration range is $1 \ldots 32767$. An acceleration equal to 0 and negative acceleration are not permitted and will result in an error message.

The setpoints are not accepted until a rising edge of Start. The drive starts up, or frequency is output, directly after the setpoints are accepted. The bit On_Target is canceled immediately and is not reset until the final position has been reached.

The Busy bit is set from the time when the setpoints are accepted until the target is reached.

New setpoints can be activated during the run by a new rising edge of Start. Movement is made toward the new position immediately at the new velocity and acceleration. Movement toward the old position is not continued (on-thefly change). This function may also change the velocity or acceleration during an ongoing process.

## Note

When using linear or $\sin ^{2}$ acceleration, the rapid setpoint acquisition can only be implemented when the drive is running with $\mathrm{v}=$ const. During constant acceleration, the new setpoint is acquired even during periods of increase.

The special features associated with limit switches and the Jog and Referencing modes are described in the corresponding sections.

### 3.11.1.4.1 Process Image Single Positioning

The single positioning process image represents the standard configuration for stepper positioning control and is shown in the following tables:

| Off- <br> set | Input data |  | Output data |  |
| :--- | :--- | :--- | :--- | :--- |
| 0 | S0 | Status byte S0 | C0 | Control byte C0 |
| 1 | Reserved |  | Reserved |  |

WAGO-I/O-SYSTEM 750

### 3.11.1.5 Referencing Mode

The mode must first be activated using Command[]=4. The referencing mode is active when the Command_ACK[]=4 bit is set.

Furthermore, the Direction_Neg bit must be set if the reference motion is to be started in negative direction, or correspondingly, the Direction_Pos if the reference motion is to be started in positive direction. The direction for the reference switch and information detailing whether movement is to be made to the reference switch or a limit switch, specified by the Reference_Mode configuration parameter.

If a reference run is started via the mailbox with the move command START_REFERENCING, the referencing velocity, starting direction, moving direction for the reference switch and the information specifying whether movement is to be made toward a reference switch or limit switch, are transferreed as parameters.

The reference run is always performed at the setup speed SpeedSetup and at the setup acceleration SetupAcceleration.

## Note

The referencing speed should be low in order to take the mechanical requirements into account (e.g., length of limit switch cams, residual travel after final shutdown, etc).

The reference run is initiated by the rising edge of the start. The drive starts up, or frequency is output, directly after the setpoints are accepted. The On_Target bit is canceled immediately and is not set again.

From the start to the end of the reference motion, the Busy bit is set.
If a limit switch is detected prior to reaching the reference switch, the reference motion is continued in the opposite direction. If prior to the detection of the reference switch a limit switch is detected again, the referencing process is terminated with an error message.

If the drive is at a limit switch it will not move further.
In Mailbox mode, the call of the command START_REFERENCING is acknowledged by error message 23 .
No error message is issued in the Referencing mode. In this case, the ERR_RANGE_NEG, or ERR_RANGE_POS bit is set and can then be evaluated.

### 3.11.1.5.1 Referencing Process Image

The operating mode process image is shown in the following tables:

| Control Byte C1 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

### 3.11.1.6 JogMode and SteppingMode

The drive can be run manually at the defined setup speed when the Jog mode is active. Control is implemented via Direction_Pos or Direction_Neg. The two control bits are locked against each other. The run is ended when the set timeout period (stepping mode) expires via the process image. A timeout of zero allows unlimited movement, as long as Direction_Pos or Direction_Neg is set (JogMode).

If the setup speed is parameterized as zero, the JogMode is run at speed 1.
If movement is made to a limit switch during the JogMode, the drive will stop. After that, movement can only be made away from the limit switch.

The drive stops when it leaves the movement range defined by the parameter Drive_Range_Neg and Drive_Range_Pos. The drive can then be operated outside the movement range using a repeated JOG command.

### 3.11.1.6.1 JogMode and SteppingMode Process Image

This process image is different from the standard configuration for stepper positioning control and is shown in the table below.

| Off- <br> set | Input data |  | Output data |  |

### 3.11.1.7 Run Program Operating Mode

A Run program can be downloaded to the I/O module via the mailbox.
The available commands for this are given in the chapter 4.3, „Commands for Move Mode".

First, the mode must be activated using M_Program. The Run program mode is active when the M_Program_ACK bit is set.

The Run program is started on a rising edge.
The address of the first command to be executed is transferred via the process image.

The Program_Running bit is set from the time of start to the end of the program. This bit can be queried using the mailbox command GET_BIT.

The On_Target and Busy bits are controlled by the individual program commands.

When the bit SetupSpeed_Active_ACK is set at the same time for setup, speed is limited to the defined setup speed.

### 3.11.1.7.1 Run Program Process Image

This process image is different from the standard configuration for stepper positioning control and is shown in the table below.

| Off- <br> set | Input data |  | Output data |  |

### 3.11.1.7.3 Example of Run Program

In this example of a Move program, first the velocity (20000) and then the acceleration (3000) is set. After this, a "True" signal is anticipated at Input 1 on line 2. If the signal is "True", movement is made to Position 1 (specified position $=65065$ ) and then the system waits for a "False" signal at input 1 on line 4. If the "False" signal is received, movement is made to Position 2 (specified position $=0$ ). The system then returns to line 2 of the Move program, i.e. it waits for a "True" signal at Input 1.

| Line <br> in the <br> run <br> table | Opcode | Data <br> (LSB) | Data | Data <br> (MSB) | Meaning |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | MB3 | MB4 | MB5 |  |  |
| 1 | $0 \times 25$ | $0 \times 20$ | $0 \times 4 \mathrm{E}$ | $0 \times 00$ | Set velocity to 20000 |
| 2 | $0 \times 71$ | $0 \times 30$ | $0 \times 01$ | $0 \times 00$ | Query, Input $1=$ " 1 " |
| 3 | $0 \times 02$ | $0 \times 20$ | $0 \times F E$ | $0 \times 00$ | Move to position 65065 |
| 4 | $0 \times 71$ | $0 \times 30$ | $0 \times 00$ | $0 \times 00$ | Query, Input $1=$ "0" |
| 5 | $0 \times 02$ | $0 \times 00$ | $0 \times 00$ | $0 \times 00$ | Move to position 0 |
| 6 | $0 \times F 5$ | $0 \times 02$ | $0 \times 00$ | $0 \times 00$ | Go to line 2 |
| 7 | $0 \times 70$ | $0 \times D 0$ | $0 \times 07$ | $0 \times 00$ | Wait 2000 ms |

### 3.11.1.7.4 Autostart

An existing Run program is started automatically after a module reset when the configuration bit HwSwConfig.Program_AutoStart (Bit 7) is set.

Prerequisites for successful automatic start:

- Valid Run program present in EEPROM,
- The HwSwConfig.Program_AutoStart bit is set in the configuration,
- The Rest status bit is set and has not yet been canceled,
- The Ready status bit is set,
- The Stop_N_ACK status bit is set.

A Run program started by HwSwConfig.Program_AutoStart can be ended by canceling Reset. The bit is reset by Reset_Quit.

A Run program is started only one time after each reset by HwSwConfig.Program_AutoStart.

A Run program started with HwSwConfig.Program_AutoStart is always started at an address of 0 .

### 3.11.1.8 Rotary Axis Operating Mode

The "Rotary axis" function is activated by the parameter Rotary_Axis_Period being written with a value other than zero. If the Rotary_Axis_Period parameter is zero, a linear and limited movement range is assumed.

The position is repeated with a rotary axis every $2 \pi$ or $360^{\circ}$. The Rotary_Axis_Period parameter indicates how many motor steps correspond to one rotation around the axis by $2 \pi$ or 360 .

The actual value for rotary axis is always within the range $0 \ldots$
Rotary_Axis_Period. This ensures that no internal overrun occurs with relative motion repeated any number of times.

| Parameter | Linear axis | Rotary axis |
| :--- | :--- | :--- |
| Rotary_Axis_Period | 0 | Micro steps per rotation >0 | | Operating range | Drive_Range_Neg |  |  |
| :--- | :--- | :--- | :--- |
| $\ldots$ |  |  |  |
| Drive_Range_Pos | Limited to Drive_Range_Neg_.. <br> Drive_Range_Pos when Drive_Range_Neg $>=0$ <br> or Drive_Range_Pos < Rotary_Axis_Period, <br> otherwise unrestricted |  |  |
| Actual value | Operating range | $0 \ldots$ Rotary_Axis_Period, periodic |  |
| Set value | Operating range | Absolute Positioning: <br> $0 \ldots$ <br> Rotary_Axis_Period | Relative Positioning: <br> $-8388607-8388607$. <br> Can be repeated any <br> number of times. <br> No internal overrun |

When specifying the parameters for the rotary axis, the following restriction must be observed for the function to be implemented correctly.

$$
v \leq \frac{\text { Speed_Div }}{\text { Speed_Mult }} * \frac{\text { Freq_Div }}{80} * 10^{3} * p
$$

| v | Maximum allowed setpoint speed |
| :--- | :--- |
| p | Rotary axis periods (parameter 64, Rotary_Axis_Period) <br> Speed_Mult |
| Scaling factor for setpoint speed <br> (parameter 28 from configuration table) |  |
| Speed_Div | Scaling factor for setpoint speed <br> (parameter 30 from configuration table) |
| Freq_Div | Prescaler for maximum speed <br> (parameter 4 from configuration table) |

The setpoint definition principally differentiates between absolute and relative positioning.

### 3.11.1.8.1 Relative Positioning

The target position is added to the current position for relative positioning. In the calculation, the operating mode "Round axis" is ignored at first, hence the "virtual target" may be outside the range $0 \ldots 2 \pi$. This allows relative positioning to be performed over several revolutions. The actual value, however, is reported only within the range $0 \ldots 2 \pi$; the number of completed revolutions can not be determined.

The motion direction depends on the qualifying symbol of the relative setpoint value.

### 3.11.1.8.2 Absolute Positioning

The target position is always within the range $0 \ldots 2 \pi$ for absolute positioning. A setpoint defined outside of this range will result in an error.

On a movement task from standstill, the system determines in what direction the target can be reached in the shortest time.

At a positioning motion with a start speed or a target speed, the motion direction is selected requiring none or the least number of direction changes.

Absolute positioning permits braking at a certain velocity setting to a precisely defined spot (e.g. coil end that is to be stopped exactly at an attitude angle of 0 from full speed, only possible via mailbox!).

### 3.11.1.9 Camshaft Operating Mode

The camshaft provides pulses as a function of position for nine (9) channels CAM1 ... CAM9. Up to 50 switching positions can be freely defined through channels $1 \ldots 8$. Channel CAM9, on the other hand, supplies a periodic signal as a function of position.

Parameterization of channels $1 \ldots 8$ is performed using a table containing 50 entries. Each entry consists of a position xp (24-bit) and a bit sample (8-bit). The bit samples each describe the position of the eight output channels CAM1 ... CAM8, which is valid starting from the assigned position xp up to the next larger position entry $\mathrm{xp}+1$.

The table entries are sorted in ascending order of the positions.
For positions below the first entry, the bit pattern of the first entry is shown.
The starting position, the cam width and the repeat period are assigned to channel 9 via the configuration.

Except for the reset condition, the activated camshaft is always active independent from the motion operation.

Contrary to other setpoint values, the switching positions of the camshaft are always shown in the unit "micro step". A conversion to or from user-specific units has not been projected.

The camshaft table cannot be edited in the terminal, but must be downloaded as a whole.

Example: Eight (8) entries are to be loaded to the camshaft table.

| Step No. | CAM |  |  |  |  |  |  |  | Position |  |  | Outputs |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | Byte 4 <br> MB5 | Byte 3 <br> MB4 | Byte 2 <br> MB3 | Byte 1 <br> MB 3 |
| 1 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0x00 | $0 \times 2 \mathrm{e}$ | 0xe0 | 0x84 |
| 2 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0x00 | 0x5d | 0xc0 | 0x44 |
| 3 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0x00 | 0xbb | 0x80 | 0x22 |
| 4 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0x01 | 0x77 | 0x00 | 0x12 |
| 5 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0x01 | 0xd4 | 0xc0 | 0x08 |
| 6 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0x02 | 0x90 | 0x40 | 0x44 |
| 7 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0x07 | 0xb0 | 0xc0 | 0x42 |
| 8 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 0x07 | 0xdf | 0xa0 | 0x41 |

The grey-shaded part of the table must be downloaded into the terminal.
In addition, the checksum for the table must be calculated. For this, the sum across all bytes is determined. Here, the checksum is $0 x b 0 \mathrm{~d}$.

Opcodes given in chapter 4.2.4.4, „Table Management Commands" are required for downloading.

The corresponding Opcodes are adjusted for this case in the table below. The complete scope and significance are described in the chapter indicated above.

### 3.11.1.10 Position Table Operating Mode

The position table permits a fixed run motion process with variable positions.
The position table stores up to 50 positions which can be invoked by motion commands.. The position table entries can be evaluated by absolute or by relative motion commands.

The position table can be downloaded. As an alternative to this, individual entries can be written or "taught" as absolute or relative positions with the current position.

### 3.11.1.10.1 Teaching of Positions

Teaching of positions using the mailbox command POS_TABLE_TEACH allows the current actual value to the saved in the position table so that it is available as a target for a Move task.

The current actual value can be saved as the reference point for relative travel measurement.

The soft limit switches Drive_Range_Pos and Drive_Range_Neg can also be taught.

### 3.11.1.11 Speed Control Operating Mode

The Frequency/Speed Control application represents a variant of stepper control. The basic functions for stepper control can still be utilized. The basic difference is the modified process image, which permits specification of frequency and speed. Speed corresponds directly to the output frequency and the frequency ramps to acceleration.

In this module, the stepper motor is operated with the default rotational speed.
The frequency/speed control system generates a definable motor rotational speed. This rotational speed can be preset via process image, the JOG mode, motion command via mailbox and by program operation, as are single positioning / stepper control.

Alternatively, the Frequency/Speed Control application is also feasible with the function "Rotary axis". If the rotary shaft configuration value does not have a parameter of zero, a value of 100000 is assumed.

The Frequency/Rotational Speed Control application is selected by selecting the Command[]=3 operating image in the cyclic process image.

In Frequency Speed Control, the position recognition operates in the background. To prevent this from triggering a shutdown via the soft limit switches with Drive_Range_Pos or Drive_Range_Neg, the parameters Rotary_Axis_Period can be used and parameters provided or simulated for a
rotary axis. If parameters have been provided for the value Rotary_Axis_Period, this value is used for the rotary axis.

The Drive_Range_Neg and Drive_Range_Pos software limit switches are also active in rotary axis mode.

If no movement range limit is desired, these parameters must lie outside the rotary axis range defined by the Rotary_Axis_Period parameter.

Step positioning/Stepper control contains a detailed description of this (selection of mode and accepting of setpoints with Start).

The Frequency/Speed Control application essentially influences speed interpretation in the process image and the evaluation of Rotary_Axis_Period. Otherwise, the complete functions of other modes, such as JogMode, referencing, run task via mailbox and program mode can be utilized.

### 3.11.1.11.1 Velocity Control Process Image

This process image is different from the standard configuration for stepper positioning control and is shown in the tables below.

| Off- <br> set | Input data |  | Output data |  |
| :--- | :--- | :--- | :--- | :--- |
| 0 | S0 | Status byte S0 | C0 | Control byte C0 |
| 1 | Reserved | Reserved |  |  |
| 2 | D0 | Actual Velocity L | D0 | Velocity L |
| 3 | D1 | Actual Velocity H | D1 | Velocity H |
| 4 | D2 | Reserved | D2 | Acceleration L |
| 5 | D3 | Reserved | D3 | Acceleration H |
| 6 | D4 | Actual position L | D4 | Reserved |
| 7 | D5 | Actual position M | D5 | Reserved |
| 8 | D6 | Actual position H | D6 | Reserved |
| 9 | S3 | Status byte S3 | C3 | Control byte C3 |
| 10 | S2 | Status byte S2 | C2 | Control byte C2 |
| 11 | S1 | Status byte S1 | C1 | Control byte C1 |

The function of the bits in control bytes $\mathrm{C} 1 \ldots \mathrm{C} 3$ and status bytes $\mathrm{S} 1 \ldots \mathrm{~S} 3$ is determined by the Frequency/Speed Control application. When switchover is made to this application, the linked locations for the old application are retained.

The meaning of the control and status bytes is given in the following tables:

| Control Byte C1 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| Command |  |  |  |  | Start | Stop2_N | Enable |
| Enable Stop2 N Start | See chapter 3.7.2, "Control Byte, Status Byte". <br> See chapter 3.7.2, "Control Byte, Status Byte". <br> Startup of drive. <br> The drive is started in the selected mode on a positive edge. If the edge is not accepted (in the Jog or Mailbox mode), an error message is generated. <br> $0 \rightarrow 1$ : The drive is started accordingly on the rising edge. <br> The specified setpoints have been accepted from the process image. <br> Movement is made directly to the new target, even if the drive is already turning. <br> A previously calculated movement sequence is started immediately when the PreCalc_ACK bit is set (instant setpoint switch). |  |  |  |  |  |  |
| Command |  | g the op eed Con | g mode. |  |  |  |  |

## Control Byte C2

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Error_ <br> Quit | PreCalc | 0 | 0 | Acc_Range_Sel | Freq_Range_Sel |  |  |

Freq_Range_Sel See chapter 3.7.2, "Control Byte, Status Byte"
Acc_Range_Sel See chapter 3.7.2, "Control Byte, Status Byte".
PreCalc
The setpoints are taken from the process image and, where required, a movement sequence precalculated. This bit must only be used in the speed control mode.
In the other operating modes, the bit must be set to 0 .
0 : Each setpoint that is transmitted via cyclic telegram traffic must be accepted and processed. A possibly pre-calculated movement process will be discarded. A movement sequence can be calculated and started using Start.
1: The setpoints from the cyclic telegram traffic are ignored and the setpoint saved for the $0 \rightarrow 1$ edge used instead. If the starting speed is zero, a movement sequence will be calculated in advance using this setpoint; this sequence can then be started with the normal delay using Start.

See chapter 3.7.2, "Control Byte, Status Byte".

### 3.11.2 Move Mode via Mailbox

The mailbox must first be displayed. This is described in chapter 3.8, „Mailbox Operation".

After that, the Move commands via mailbox mode must be activated. This is accomplished by setting bit 7 in the control byte C 1 .

Only then, the motion commands can be given.

### 3.11.2.1 Run Commands

The module can be operated with the mailbox by using the move commands. Movement can be made directly to different positions. This command is accepted only when the mode Move mode via mailbox has been activated.

Available commands for run mode are can be found in chapter 4.3, "Commands for Move Mode".

### 3.11.3 Limitation of Moving Range

### 3.11.3.1 Hardware, Limit Switch

The hardware limit switches are active in the Positioning and Velocity control applications. These devices limit the movement path.

Any allocation of limits switches to the direction of movement must be maintained. The negative hardware limit switch (LimitSwitch_Neg bit) is linked to Input6 by default and restricts the range to smaller positions; i.e. in the negative direction.
The positive hardware limit switch (LimitSwitch_Pos bit) is linked to Input5 by default and restricts the range to larger positions; i.e. in the positive direction.

## Positioning

If movement is made to a limit switch in the Positioning mode, the drive will brake the movement until standstill using the defined deceleration Acceleratio_Stop_Fast.
The drive can only be started in the Jog and Referencing modes when it is located at a limit switch.

## JogMode

If movement is made to a limit switch in the JogMode, the drive will brake the movement until standstill using the defined deceleration Acceleratio_Stop_Fast.
The drive can then be moved away from the limit switch by pressing the "Jog" button Direction_Neg or Direction_Pos again, from the positive limit switch in a negative direction and from the negative limit switch in a positive direction.
The drive will again decelerate to a standstill using the defined deceleration Acceleration_Stop_Fast as soon as it moves away from the limit switch. The drive is then no longer located at the limit switch and can be run in any mode without any restrictions.

## Referencing

## Warning

The software limit switch does not evaluate limiting of the moving range during the reference run. This may result in damage to the system if proper functioning of the hardware limit switch is not ensured!

If the drive is located at a limit switch in the Referencing mode to a reference switch, it can only be started in the Jog or Referencing mode. Only a negative direction of movement is possible from the positive limit switch and vice versa.

If a reference run has been made to a limit switch in the Referencing mode, the drive will end up at the limit switch and a special operating mode will be activated.
In this special mode, the drive can be moved away from the limit switch in any mode, with the positive limit switch only permitting movement in a negative direction and the negative limit switch in a positive direction. The special mode is terminated 100 ms after the drive leaves the limit switch.

### 3.11.3.2 Software Limit Switch

The permissible movement range of the drive is limited by the hardware limit switch. Options are also available, however, for restricting the permissible movement range using limits that can be parameterized (software limit switches), for example if no hardware limit switches are available.

## Note

Evaluation of the hardware limit switches has priority over evaluation of the software limit switches.

The software limit switches are defined by the limits Drive_Range_Neg and Drive_Range_Pos in the Configuration table. The limit Drive_Range_Neg restricts the range to smaller positions; i.e., in the negative direction. Drive_Range_Pos restricts the range to larger positions; i.e., in the positive direction.

The software limit switches are only active in the Positioning and Run program via mailbox modes, as well as some subfunctions being available in the JogMode. The switches are not evaluated in other modes.

## Warning

The software limit switch does not evaluate limiting of the moving range during a reference run. This may result in damage to the system if proper functioning of the hardware limit switch is not ensured!

The limits Drive_Range_Neg and Drive_Range_Pos define the permissible range of movement. If one of these defined limits is violated, the associated bit is set.
The default setting is Drive_Range_Neg = 0x800001 and Drive_Range_Pos = 0x7FFFFF

If movement is made beyond a defined movement range, the drive is brought to standstill using the defined deceleration Acceleration_Stop_Fast and, after that, only those directions of movement accepted that move the unit back into the permissible range; the exception here is the JogMode.

In the JogMode the drive is brought to a standstill each time it attempts to move out of the permissible range. In this mode the drive can also be operated outside the movement range defined by the software limit switches with repeated JOG commands. The software limit switches are not active again until the drive is back within the defined range.

### 3.11.4 Control of a Motor Brake

Control of the motor brake is conducted using the Brake bit (see chapter 4.5, „Bit Field for I/O Driver").

Control of this bit is performed from two sources that are connected with an OR link.
On the one hand, the brake bit is set automatically as soon as the drive is running and is canceled as soon as the drive is at standstill. Automatic control is configured using the configuration parameters Braketime_Turn_On and Braketime_Turn_Off. The Brake bit is then activated directly after the start of a run command. If the bit has not been set, execution of the move command will, however, be delayed by the Braketime_Turn_On time. The configuration parameter Braketime_Turn_Off defines the deactivation time for the Brake bit. This bit is deactivated before the target is reached by the Braketime_Turn_Off time. The brake can be controlled directly with this bit. The brake is released when the bit is set, and is applied when the bit is canceled.

Fig. 3.11.4-1: Control of motor brake
g067x17e
As an alternative, the brake can also be operated independently using the Brake_Manual bit (see chapter 4.5, „Bit Field for I/O Driver"). This bit can be set and canceled externally and can also, for example, be linked to a camshaft channel so that it is switched as a function of position.

### 3.12 Diagnostics and Errors

The diagnostics commands allow internal module information to be accessed. This includes:

- Error status of the device,
- Variables and status bits,
- Password,
- Configuration table and
- Position table

### 3.12.1 Error Messages and Evaluation

Depending on the configuration in synchronous process image, errors and warnings are indicated by the following common error bits:

- Error (S2.7) (see chapter 3.7.2,"Control Byte, Status Byte")
- Error_Quit (C2.7) (see chapter 3.7.2,"Control Byte, Status Byte")
- ERR (S0.6) (see chapter 3.7.2,"Control Byte, Status Byte")

The module has an error memory that can record exactly one error code. The simultaneous occurrence of multiple errors is not supported.

To determine the cause of the error, the error code can be queried via the mailbox. The following commands are available:

| Function | Opcode | Meaning | Page |
| :--- | :--- | :--- | :--- |
| Diagnostics Commands |  |  |  |
| DIAG_RD_ERROR | $0 x 49$ | Error information is recovered from the <br> error memory. | 169 |
| DIAG_QUIT_ERROR | $0 x 4 \mathrm{~A}$ | Terminates a device error condition | 170 |

The commands are described in the appendix in chapter 4.2.4.5, "Diagnostics Commands".

### 3.12.2 Error Acknowledgement

The errors and warnings of all subsystems are analyzed at a central location.
The occurrence of errors and warnings is recorded and leads the device into an error condition.

In the case of error messages, the output stage is terminated immediately. The motor has no torque in this state and is at risk of uncontrolled movements, which can be prevented with an external brake.

The error or warning condition continues until the cause is remedied.

WAGO-IIO-SYSTEM 750
I/O Modules

## Note

The bit Error (S2.7) follows statically bit Error_Quit (C2.7). If the cause of the error is not eliminated, the bit Error_Quit is set again!

If no more errors or warnings are reported by the hardware, the error or warning condition can be acknowledged with the positive edge by the control bit Error_Quit or with a mailbox command DIAG_RD_ERROR.

### 3.12.3 Internal Data Bus Parameterization: Accumulative Diagnostics

Errors/warnings can also be reported in status byte S0, bit 6 (ERR) and thus initiate an acyclic diagnostics message (e.g., via Profibus).
This bit is addressed continuously as long as the error is present and Error_Quite is not set.
Enabling for the indication of errors is set using the configuration parameter ErrorNotificationMode.SystemFlagEnable (parameter 113, bit 0). This bit has the following meaning:

0: Errors are not reported via status byte S0, bit 6 (ERR).
1: $\quad$ Errors are reported via status byte S0, bit 6 (ERR).
Warning displays are enabled using the configuration parameter WarningNotificationMode.SystemFlagEnable (parameter 116, bit 0).

This bit has the following meaning:
0: $\quad$ Warnings are not reported via status byte S 0 , bit 6 (ERR).
1: Warnings are reported via status byte S0, bit 6 (ERR).

### 3.12.4 Sequence Diagram for Troubleshooting

### 3.12.4.1 Cause of error was eliminated before acknowledgement

3.12.4.2 Cause of error was not eliminated before acknowledgement

Fig. 3.12.4-2: Sequence diagram for troubleshooting 2
g067226e

### 3.13 Diagnostics

The diagnostics commands allow internal module information to be accessed. This includes:

- Error status of the device,
- Variables and status bits,
- Password,
- Configuration table and
- Position table

Fig. 3.12.4-1: Advanced diagnostics
g067211e
The commands are elucidated in the appendix in section Diagnostics Commands, „Diagnostics Commands".

The procedures for error correction are described in the appendix to chapter 4.4, "Error Blink Codes".

### 3.13.1 Internal Status Variables

The module is provided with internal status variable that can be read out using the mailbox command DIAG_RD_VAR. These variables can also be acquired automatically using a data recorder.

The number of the variable determines which source is read:

| Variable number | Source |
| :--- | :--- |
| $0-0 \times 1000$ | predefined variables are read (see chapter 4.7, „Internal State <br> Variables") |
| $0 \times 1000 \ldots 0 \times 1100:$ | predefined bits $0 \ldots . .0 \times 100$ are read (see chapter 4.5, "Bit <br> Field for I/O Driver") |

The status variables are elucidated in the appendix in chapter 4.7, „Internal State Variables".

### 3.13.2 Data Recorder

The data recorder facilitates the recording of two internal variables in a selectable time grid for a later analysis. 500 values are recorded each time.

The configuration values Trace_Var1 and Trace_Var2 contain the index for the variables to be recorded (see chapter 4.7, "Internal State Variables"). The configuration value Trace_MsecCycleTime denotes the scan (cycle) time in ms.

| Configuration values | Meaning |
| :--- | :--- |
| Trace_Var1 | Index of the first variable to be recorded |
| Trace_Var2 | Index of the second variable to be recorded |
| Trace_MsecCycleTime | Scan time in ms |

The Trace_Stored bit indicates that a complete data set has been recorded.
A $0 \rightarrow 1$ edge of Trace_Trigger initiates recording when the Trace_Armed bit is set.

A traced (recorded) data set can be read out using an upload command from the table manager (see chapter 3.9, "Table Manager").

| Bits | deleted | set |
| :--- | :--- | :--- |
| Trace_Stored | No dataset present | Dataset is recorded |
| TRACE_TRIGGER | $0 \rightarrow 1$ Edge starts the recording |  |
| Trace_Armed | Triggering is disabled, an existing <br> dataset is not overwritten. | Triggering is active, the next <br> trigger event initiates the <br> recording. |

The internal bits (see chapter 4.5, „Bit Field for I/O Driver") can be used as triggering sources. This is accomplished by entering the corresonponding link in the configuration table. The control system can also initiate recording using the mailbox commands GET_BIT and SET_BIT. The trigger bits must be linked to the MONE internal bit for this.

### 3.14 Installation Instructions

The following representation describes the components that are required for a structure that complies with standards.

Additional measures may be necessary, according to the table, depending on whether installation is made in a residential, industrial, or marine area.

Fig. 3.13.2-1: Overview of installation

### 3.15 Connection Example

Fig. 3.13.2-1: Connection example

## Note

Observe the star wiring in the 0 V and 0 V _Motor masses!

WAGO-I/O-SYSTEM 750 I/O Modules

### 3.16 Recommendations to Avoid Overvoltage when Decelerating or Sinking a Vertical Load

During quick deceleration or reversal of the axis, or during sinking of a vertical load, the braking energy is fed back into the motor's current voltage. This can increase the intermediate circuit voltage.

However, both the drive itself and the feeding device, as well as other users of this voltage increase, can still be endangered and should be protected! When the voltage reaches the definable limit value of $\mathrm{U}_{\max }=$ DC_Link_ $\mathrm{U}_{\max }$, the overvoltage error is issued and the motor control is switched off.

A larger power supply unit, additional users or an external condenser must be able to accommodate the energy that has been fed back in. The external condenser must be designed for a voltage of at least 100 V .
$C=\frac{2^{*} W_{\text {mech }}}{U_{\text {max }}{ }^{2}-U_{D C}{ }^{2}}-C_{\text {int }}$
$\mathrm{W}_{\text {mech }} \quad$ Mechanical energy fed back in
$\mathrm{U}_{\text {max }} \quad$ Parameter DC_Link_U $\max$
UDC Motor supply
$\mathrm{C}_{\text {int }} \quad 400 \mu \mathrm{~F}$

### 3.17 Information on Motor Selection

### 3.17.1 Nominal Current

The specifications in the manual for the motor current are peak values. The data sheet specifications for motors must be interpreted as effective values.
In full step operation, there is no difference between effective values and peak values.

However, due to the microsteppings, the stepper controller 750-672 has an approximately sinusoidal current flow.

## Example:

A motor should be implemented for the stepper controller 750-672.
The nominal current for continuous operation results in:
$I_{n}=\frac{5 A}{\sqrt{2}}=3,5 A$
This value is the nominal current in the motor's data sheet.
The motor can be implemented in continuous operation without overheating.
The 7.5 A current only applies to the acceleration phases (150\%).

Warning: this current is only delivered for a maximum of 10 s !
The current controller is implemented as a two- or three-point controller. This has the advantage that the controller is always stable and the comparison is simplified. The controller frequency adjusts automatically and changes with the current. The controller frequency is prevented from becoming too high. A controller frequency that is too small leads to a whistle and can be changed as needed with the parameter Current_Ctrl_TZMax.
The motor inductance should lie in the range of a few mH .
The winding resistance should lie in the range of $0.2 \Omega$ to $0.8 \Omega$.

### 3.17.2 Measurement of Motor Inductance

The following equations are tailored quantity equations.
The formula symbols have the following units:
I [A] Motor current (parameter 14, current)
U [V] UDC motor supply
L [ mH ] Inductance of a cable's motor winding
$\mathrm{f}_{\mathrm{m}}[\mathrm{Hz}]$ Mechanical rotational speed
p [1] Number of pole pairs (typically 50)

1. Requirement for minimum inductance:

The current ripple should not exceed $10 \%$ of the motor current.
$L \geq \frac{0,16 * U}{I}$
2. Requirement for maximum inductance:
a) For a good dynamic, the inductance should not become too large.
$L \leq \frac{U}{I}$
b) The self-induction voltage should not exceed $1 / 3$ of the motor voltage.
$L \leq \frac{53}{p * f_{m}} * \frac{U}{I}$
The ranges of acceptable motor inductance are shown in the following graphics for several combinations.

Fig. 3.17.2-1: Range of acceptable motor inductance for $\mathrm{I}=5 \mathrm{~A}$

Fig. 3.17.2-2: Range of acceptable motor inductance for $\mathrm{I}=2.5 \mathrm{~A}$

Fig. 3.17.2-3: Range of acceptable motor inductance for $\mathrm{I}=1 \mathrm{~A}$
g067224e

### 3.18 Process Priorities

The task of process control is to coordinate timely semi-parallel running processes in a reasonable manner and to divide up the computing time of the microprocessor according to the necessary priorities.
Foreground computing processes have a high priority.
The following table provides an overview of the task system.

| Priority | Interrupt | Type | Frequency Type | Execution Time Type | Incorporated Functionality |
| :---: | :---: | :---: | :---: | :---: | :---: |
| high | Exception | Exception | - | - | Error message, unknown system status |
|  | Watchdog | Exception | - | - | Error message, watchdog |
|  | Timer $62 \mu \mathrm{~s}$ | periodic | 16 kHz | $\begin{aligned} & 10 \ldots \\ & 20 \mu \mathrm{~s} \end{aligned}$ | - Time measurement <br> - Frequency ramps <br> - Position recognition |
|  | $\begin{aligned} & \text { Timer } \\ & 62 \mu \mathrm{~s} \end{aligned}$ | periodic | 4 kHz | $20 \mu \mathrm{~s}$ | - Set DOs <br> - Filter functions: counter |

## 4 Appendix

### 4.1 Calculation Formulas

### 4.1.1 Position

### 4.1.1.1 Full Step Angle

Correlation between the number of full steps and the step angle

$$
N=\frac{360^{\circ}}{\alpha}
$$

N [1] Number of full steps
$\alpha$ [ ${ }^{\circ}$ ] Full step angle
Correlation between the number of pole pairs and the full step angle
$\alpha=\frac{180^{\circ}}{\left(p^{*} s\right)}$
$\alpha=\frac{90^{\circ}}{p}$
$\alpha$ [ ${ }^{\circ}$ ] Full step angle
p [1] Number of pole pairs
s [1] Line number $\mathrm{s}=2$
A typical industrial motor has a step angle of $1.8^{\circ}$ corresponding to 200 full steps and a pole pair number of $\mathrm{p}=50$.

Correlation between electric and mechanical sizes

$$
f_{e}=p^{*} f_{m} \quad \text { or } \quad \omega_{e}=p^{*} \omega_{m} \quad \text { with } \quad \omega=2 * \pi^{*} f
$$

f [1/s] Frequency
p [1] Number of pole pairs
$\omega_{\mathrm{e}}$ [1/s] Angular frequency of motor current of winding
$\omega_{\mathrm{m}}[1 / \mathrm{s}]$ Angular frequency of axis

### 4.1.1.2 Rotor Bearing

Correlation between the position specification in the process data and the rotor bearing on the motor axis
$\varphi=360^{\circ} * \frac{s}{64 * N}$
$\varphi\left[^{\circ}\right]$ Rotor bearing, axis angle
s [1] Setpoint position in process image
N [1] Number of full steps

### 4.1.1.3 Rotary Axis

When specifying the parameters for the rotary axis, the following restriction must be observed for the function to be implemented correctly.

$$
v \leq \frac{\text { Speed_Div }}{\text { Speed_Mult }} * \frac{\text { Freq_Div }}{80} * 10^{3} * p
$$

| v | Maximum allowed setpoint speed |
| :--- | :--- |
| p | Rotary axis periods (parameter 64, Rotary_Axis_Period) <br> Speed_Mult <br> Scaling factor for setpoint speed <br> (parameter 28 from configuration table) |
| Speed_Div | Scaling factor for setpoint speed <br> (parameter 30 from configuration table) |
| Freq_Div | Prescaler for maximum speed <br> (parameter 4 from configuration table) |

### 4.1.2 Rotational Speed

### 4.1.2.1 Frequency

Correlation between the internal pulse frequency and the mechanical rotational speed at the motor axis

$$
f_{m}=\frac{1}{p} * \frac{f_{p}}{256}
$$

$f_{m}$ Rotational speed at the motor axis revolutions per second
p Number of pole pairs
$f_{p}$ Internal pulse frequency

### 4.1.2.2 Frequency Prescaler

The drive speed is identified by the pulse frequency $f_{p}$

$$
f p=\frac{\text { Velocity } * 80}{\text { Freq_Prescaler }[\mathrm{Hz}]}
$$

$\mathrm{f}_{\mathrm{p}}$ Pulse frequency
The acceptable velocity range is $1 \ldots 25000$. The setting for the pulse frequency in $[\mathrm{Hz}]$ is given by selecting Freq Prescaler $=80$.

### 4.1.2.3 Calculation via Internal Pulse Frequency

Correlation between velocity specification in the process data and internal pulse frequency

$$
f_{p}=\frac{\text { Speed_Mult }}{\text { Speed_Div }} * \frac{80 * v}{\text { Freq_Div }}
$$

$\mathrm{f}_{\mathrm{p}}$ [1/s] Internal pulse frequency in increments per second ${ }^{\wedge} 2$
$v$ [1] Setpoint velocity in process image
Speed_Mult Scaling factor for setpoint velocity (parameter 28 from configuration table)
Speed_Div Scaling factor for setpoint velocity (parameter 30 from configuration table)
Freq_Div Prescaler for maximum velocity
(parameter 4 from configuration table)
Correlation between the internal pulse frequency and the mechanical rotational speed at the motor axis
$f_{m}=\frac{1}{p} * \frac{f_{p}}{256}$
$\mathrm{f}_{\mathrm{m}}$ [1/s] Rotational speed at the motor axis in revolutions per second
p [1] Number of pole pairs
$f_{p}$ [1/s] Internal pulse frequency in increments per second ${ }^{\wedge} 2$

### 4.1.2.4 Direct Calculation

## Correlation between velocity specification in the process data and mechanical rotational speed at the motor axis

$$
\begin{aligned}
& f_{m}=\frac{1}{p} * \frac{\text { Speed_Mult }}{\text { Speed_Div }} * \frac{v}{3,2 * \text { Freq_Div }} \\
& n_{m}=60 * f_{m}
\end{aligned}
$$

$\mathrm{f}_{\mathrm{m}}[1 / \mathrm{s}] \quad$ Rotational speed at the motor axis in revolutions per second
p [1] Number of pole pairs
v [1] Setpoint velocity in process image

Speed_Mult Scaling factor for setpoint velocity
(parameter 28 from configuration table)
Speed_Div Scaling factor for setpoint velocity
(parameter 30 from configuration table)
Freq_Div Prescaler for maximum velocity
(parameter 4 from configuration table)

### 4.1.3 Acceleration

Acceleration Factor

$$
a=\text { Acceleration } * \frac{\text { Acc_Multiplier }}{\text { Freq_Prescaler }\left[\frac{\mathrm{Hz}}{\mathrm{~s}}\right]}
$$

a
Acceleration
Acceleration Setpoint acceleration
The permissible acceleration range is $1 \ldots 32767$.
Acceleration is set in $[\mathrm{Hz} / \mathrm{s}]$ when the acceleration factor Acc_Multiplier is selected equal to the prescaler Freq_Prescaler.

Correlation between internal acceleration and specification in the process data

a Acceleration
Acceleration
Acc_Mult
Setpoint acceleration
Scaling factor for setpoint acceleration (parameter 32 from configuration table)
Acc_Div Scaling factor for setpoint acceleration
(parameter 34 from configuration table)
Acc_Fac Factor for maximum acceleration
(parameter 6 from configuration table)
Freq_Div Prescaler for maximum velocity
(parameter 4 from configuration table)
Correlation between the internal acceleration and the mechanical acceleration
$a_{m}=\frac{1}{p} * \frac{a}{256}$
$\mathrm{a}_{\mathrm{m}}\left[1 / \mathrm{s}^{\wedge} 2\right] \quad$ Acceleration at the motor axis in revolutions per second ${ }^{\wedge} 2$
p [1] Number of pole pairs
v [1] Target velocity in process image

### 4.1.4 Electric Parameters

### 4.1.4.1 Motor Constant

The motor constant $K_{m}$ can be calculated from the data sheet specifications as follows:
$M_{h}=K_{m} * I_{n}$
$\mathrm{M}_{\mathrm{h}}[\mathrm{N}] \quad$ Holding torque
$\mathrm{K}_{\mathrm{m}} \quad$ Motor constant
$\mathrm{I}_{\mathrm{n}}$ [A] Motor current vertex
or, alternatively, from the measurement of open-circuit voltage $U_{\text {emf: }}$ :
$U_{e m f}=K_{m} * \omega_{m}$
$\mathrm{U}_{\mathrm{emf}} \quad[\mathrm{V}] \quad$ Open-circuit voltage vertex of a motor winding
$\mathrm{K}_{\mathrm{m}} \quad$ Motor constant
$\omega_{\mathrm{m}} \quad[1 / \mathrm{s}] \quad$ Angular frequency, mechanical

### 4.1.4.2 Supply Voltage

The following formulas describe the correlation between rotational speed, torque and the minimum required supply voltage $\mathrm{U}_{\mathrm{DC}}$.

The correlation between the voltage vectors can be depicted by the following vector diagram:

Fig. 4.1.4-1: Vector diagram

## Minimum Required Motor Voltage

$U_{D C}=\sqrt{U^{2}{ }_{L}+\left(U_{r}+U_{e m f}\right)^{2}}$
$\mathrm{U}_{\mathrm{DC}} \quad[\mathrm{V}] \quad$ Minimum required motor voltage
$\mathrm{U}_{\mathrm{L}} \quad[\mathrm{V}] \quad$ Voltage via inductance of motor winding
Ur [V] Voltage via ohmic resistance of motor winding
$\mathrm{U}_{\mathrm{emf}} \quad[\mathrm{V}] \quad$ Open-circuit voltage vertex of a motor winding
Voltage via ohmic resistance of motor winding
$U_{r}=I * R$
$\mathrm{U}_{\mathrm{r}} \quad[\mathrm{V}] \quad$ Voltage via ohmic resistance of motor winding
I [A] Motor current vertex
$\mathrm{R} \quad[\mathrm{W}] \quad$ Winding resistance of a motor winding, incl. supply line resistance

Voltage via inductance of motor winding
$U_{L}=I * \omega_{m} * L$

| $\mathrm{U}_{\mathrm{L}}$ | $[\mathrm{V}]$ | Voltage via inductance of motor winding |
| :--- | :--- | :--- |
| I | $[\mathrm{A}]$ | Motor current vertex |
| $\omega_{\mathrm{e}}$ | $[1 / \mathrm{s}]$ | Angular frequency, electric |
| L | $[\mathrm{H}]$ | Inductance of a motor winding |

## Open-circuit voltage vertex of a motor winding

$$
U_{e m f}=K_{m} * \omega_{m}
$$

$\mathrm{U}_{\mathrm{emf}} \quad[\mathrm{V}] \quad$ Open-circuit vertex of a motor winding
$\mathrm{K}_{\mathrm{m}} \quad$ Motor constant
$\omega_{\mathrm{m}} \quad[1 / \mathrm{s}] \quad$ Angular frequency, mechanical

### 4.1.4.3 Current Profile Setting

A lower overcurrent can be supplied by the module for a correspondingly longer time.

The time until deactivation results from the following correlation:
$t_{\text {off }}=\frac{5 A}{I_{\text {OV }}-5 A} * 5 \mathrm{~s}$
$\mathrm{t}_{\text {off }} \quad$ Time until shutdown
$\mathrm{I}_{0 \mathrm{v}} \quad$ Overcurrent
After operation with overcurrent, a phase with reduced current must follow, in order for the module's thermal model to return to its original state. The required cooling time ( $\mathrm{t}_{\text {cool }}$ ) is calculated as follows:
$t_{\text {cool }}=4 * \frac{I_{O V}-5 A}{5 A-I_{r e}} * t_{O V}$
$\mathrm{t}_{\text {cool }} \quad$ Cooling time
$\mathrm{I}_{0 \mathrm{v}} \quad$ Overcurrent
$\mathrm{I}_{\mathrm{re}} \quad$ Reduced current
$\mathrm{t}_{0 \mathrm{~V}}$ Duration

### 4.1.4.4 Buffer Condenser

$$
C=\frac{2 * W_{\text {mech }}}{U_{\max }^{2}-U_{D C}^{2}}-C_{\text {int }}
$$

$\mathrm{W}_{\text {mech }} \quad$ Mechanical energy fed back in
$\mathrm{U}_{\text {max }} \quad$ Parameter DC_Link_U max
U DC Motor supply
$\mathrm{C}_{\text {int }} \quad 400 \mu \mathrm{~F}$

### 4.2 Mailbox Commands

### 4.2.1 Overview of Mailbox Commands

| Function | Opcode | Meaning | Page |
| :---: | :---: | :---: | :---: |
| General commands |  |  |  |
| IDLE | 0x00 | No task | 152 |
| Drive commands |  |  |  |
| DRIVE_COMMAND | 0x40 | Command for Move mode | 153 |
| Download command |  |  |  |
| DLD_START | 0x41 | Download Start | 154 |
| DLD_CONT | 0x42 | Download Continue | 157 |
| DLD_END | 0x43 | Completion of download | 160 |
| Table management commands |  |  |  |
| TABLE_ERASE | 0x44 | Tables will be deleted. | 161 |
| TABLE_COPY | 0x45 | Tables will be copied. | 163 |
| TABLE_START | 0x46 | Table is activated | 166 |
| TABLE_STOP | 0x48 | Ends table processing | 167 |
| TABLE_GET_ACTIVE | 0x4F | Determine active table | 168 |
| Diagnostics commands |  |  |  |
| DIAG_RD_ERROR | 0x49 | Information about error retrieved from error memory | 169 |
| DIAG_QUIT_ERROR | 0x4A | Terminates a device error condition | 170 |
| DIAG_RD_VAR | 0x4C | Read out internal variable | 171 |
| DIAG_RD_BIT | 0x4D | Read out internal bit | 172 |
| DIAG_QUERY STORAGE | 0x4E | Read out storage process status bit | 173 |
| Configuration table commands |  |  |  |
| CONFIG_SET_PTR | 0x50 | Set address for data access to the configuration | 174 |
| CONFIG_WR | 0x51 | Write access to configuration value | 175 |
| CONFIG_RD | 0x52 | Read access to configuration value | 176 |
| CONFIG_SAVE | 0x53 | Saves the current RAM configuration | 177 |
| CONFIG_RESTORE | 0x54 | Restores the configuration | 178 |

| Function | Opcode | Meaning | Page |
| :--- | :--- | :--- | :--- |
| Position table commands |  |  |  |
| POS_TABLE_CREATE | $0 \times 5 \mathrm{C}$ | Generates a position table in the RAM. | 180 |
| POS_TABLE_SET_PTR | $0 \times 5 \mathrm{D}$ | Sets an index for the subsequent entry to <br> be written with POS_TABLE_WR in the <br> position table | 181 |
| POS_TABLE_WR | $0 \times 5 \mathrm{E}$ | Writes an entry to the active position <br> table | 182 |
| POS_TABLE_TEACH | $0 \times 5 \mathrm{~F}$ | Writes the current position to the active <br> position table | 183 |

### 4.2.2 Overview of Mailbox Commands, Sorted by Opcodes

| Function | Opcode | Meaning | Page |
| :---: | :---: | :---: | :---: |
| IDLE | 0x00 | No task | 152 |
| DRIVE_COMMAND | 0x40 | Command for Move mode | 153 |
| DLD_START | 0x41 | Download Start | 154 |
| DLD_CONT | 0x42 | Download Continue | 157 |
| DLD_END | 0x43 | Completion of download ... | 160 |
| TABLE_ERASE | 0x44 | Tables being deleted ..... | 161 |
| TABLE_COPY | 0x45 | Tables being copied ... | 163 |
| TABLE_START | 0x46 | Activates a table | 166 |
| TABLE_STOP | 0x48 | Ends table processing | 167 |
| DIAG_RD_ERROR | 0x49 | Information about error retrieved from error memory | 169 |
| DIAG_QUIT_ERROR | 0x4A | Terminates a device error condition | 170 |
| DIAG_RD_VAR | 0x4C | Read out internal variable | 171 |
| DIAG_RD_BIT | 0x4D | Read out internal bit | 172 |
| DIAG_QUERY_ STORAGE | 0x4E | Read out storage process status bit | 173 |
| TABLE_GET_ACTIVE | 0x4F | Determine active table | 168 |
| CONFIG_SET_PTR | 0x50 | Set address for data access to the configuration | 174 |
| CONFIG_WR | 0x51 | Write access to configuration value | 175 |
| CONFIG_RD | 0x52 | Read access to configuration value | 176 |
| CONFIG_SAVE | 0x53 | Saves the current RAM configuration | 177 |
| CONFIG_RESTORE | 0x54 | Restores the configuration | 178 |
| POS_TABLE_CREATE | 0x5C | Generates a position table in the RAM. | 180 |
| POS_TABLE_SET_PTR | 0x5D | Sets an index for the subsequent entry to be written with POS_TABLE_WR in the position table | 181 |
| POS_TABLE_WR | 0x5E | Writes an entry to the active position table | 182 |
| POS_TABLE_TEACH | 0x5F | Writes the current position to the active position table | 183 |

### 4.2.3 Overview of Mailbox Commands, Sorted by Functions

| Function | Opcode | Meaning | Page |
| :---: | :---: | :---: | :---: |
| CONFIG_RD | 0x52 | Read access to configuration value | 176 |
| CONFIG_RESTORE | 0x54 | Restores the configuration | 178 |
| CONFIG_SAVE | 0x53 | Saves the current RAM configuration | 177 |
| CONFIG_SET_PTR | 0x50 | Set address for data access to the configuration | 174 |
| CONFIG_WR | 0x51 | Write access to configuration value | 175 |
| DIAG_QUERY_ STORAGE | 0x4E | Read out storage process status bit | 173 |
| DIAG_QUIT_ERROR | 0x4A | Terminates a device error condition | 170 |
| DIAG_RD_BIT | 0x4D | Read out internal bit | 172 |
| DIAG_RD_ERROR | 0x49 | Information about error retrieved from error memory | 169 |
| DIAG_RD_VAR | 0x4C | Read out internal variable | 171 |
| DLD_CONT | 0x42 | Download Continue | 157 |
| DLD_END | 0x43 | Completion of download ... | 160 |
| DLD_START | 0x41 | Download Start | 154 |
| DRIVE_COMMAND | 0x40 | Command for Move mode | 153 |
| IDLE | 0x00 | No task | 152 |
| POS_TABLE_CREATE | 0x5C | Generates a position table in the RAM. | 180 |
| POS_TABLE_SET_PTR | 0x5D | Sets an index for the subsequent entry to be written with POS_TABLE_WR in the position table | 181 |
| POS_TABLE_TEACH | 0x5F | Writes the current position to the active position table | 183 |
| POS_TABLE_WR | 0x5E | Writes an entry to the active position table | 182 |
| TABLE_COPY | 0x45 | Tables being copied ... | 163 |
| TABLE_ERASE | 0x44 | Tables being deleted ..... | 161 |
| TABLE_GET_ACTIVE | 0x4F | Determine active table | 168 |
| TABLE_START | 0x46 | Activates a table | 166 |
| TABLE_STOP | 0x48 | Ends table processing | 167 |

### 4.2.4 Reference Commands - Mailbox Commands

### 4.2.4.1 General commands

### 4.2.4.1.1 IDLE ( $0 \times 00$ )

No task is performed if the value for "Opcode" is 0 .

### 4.2.4.2 Move Commands

### 4.2.4.2.1 DRIVE_COMMAND (0x40)

The module can be operated via the mailbox using the move commands. Movement can be made directly to different positions. This command is accepted only when the mode "Move task via mailbox"(chapter Fehler! Verweisquelle konnte nicht gefunden werden., „Fehler! Verweisquelle konnte nicht gefunden werden.") has been activated.

The commands available for the Move mode are described in chapter 4.3, "4.3".

| Request |  |  |  |  |  |  |  |  |

|  |  | 0x13: | Unknown command |  |  |  |  |  |
|  |  | 0x23: |  | ess | ied |  |  |  |

### 4.2.4.3 Download Commands

### 4.2.4.3.1 DLD_START (0x41)

## Download Start

Tables are always loaded into RAM (1 or 2) first. The cursor is first placed on the first entry. Only one table can be loaded at any one time; any previous, incomplete download is canceled and becomes invalid. Direct transfer to / from the EEPROM is not possible (see also TABLE_COPY). Download to the same RAM sector is rejected with an error message when a move program table is still active. Camshaft and position tables can also be overwritten when they are active.

## Default assignment

The default assignment for moving curve tables is PROG_END ( $0 \times 00$ ). Camshaft tables have the default assignment 0x80000000 (invalid position). The default assignment for position tables is 0 .

## Configuration tables

The EEPROM version number is expected in byte 5 during download of a configuration table. A complete table, with 128 data values, 32 bit each, is always expected.

## Download formats (see also Request Data 4)

## Expanded 32-bit down-/upload

A DLD_CONT must be used for an 8-bit command / data sample and for a 32bit data entry / position entry in the table when downloading a Move program / a camshaft table. MB 4... 6 are ignored for an 8-bit command / data sample.

## Compressed 24-bit down-/upload

When downloading a Move program / a camshaft table, those items are transferred with a DLD_CONT command for an 8-bit command / data sample and a 24 -bit date entry / position entry.

Maximum number of data sets (see also Request, Byte 5 and 6)

| Table | Typ <br> $\mathbf{e}$ | Max. number of data sets |
| :--- | :--- | :--- |
| Move program: | 1 | 400 |
| Camshaft | 2 | 50 |
| Position table | 3 | 50 |
| Configuration | 4 | 128 |
| Trace | 5 | 1000 |

| Response |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |
| MB0 | 0x41 |  |  |  |  |  |  |  |
| MB1 | T | Return Code |  |  |  |  |  |  |
| MB2 | Status |  |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Number of data sets |  |  |  |  |  |  |  |
| MB5 | EEPROM version number |  |  |  |  |  |  |  |
| Return Code | 0x00: OK |  |  |  |  |  |  |  |
|  | 0x30: |  | Table being used |  |  |  |  |  |
|  | $0 \times 31$ : |  | General error |  |  |  |  |  |
| Status | 0 : |  | Download/Upload can be started |  |  |  |  |  |
|  | 1 : |  | Error; Download/Upload not possible |  |  |  |  |  |

WAGO-I/O-SYSTEM 750
I/O Modules

### 4.2.4.3.2 DLD_CONT (0x42)

## Download Continue

An entry is written to the selected table. The cursor is then moved to the next element. The request data are ignored for an upload. An error is returned when it is detected during a download that a transmitted Move table command is invalid, or if camshaft entries are transmitted NOT in ascending order. The data that has been transmitted will not be corrected. The table can not be valid with DLD_END however.

## Download formats:

## Expanded 32-bit down-/upload

A DLD_CONT must be used for an 8-bit command / data sample and for a 32bit data entry / position entry in the table when downloading a Move program / a camshaft table. MB $4 \ldots 6$ are ignored for an 8 -bit command / data sample.

## Move program table (Type 01)

| $\ldots$ |  |  |  |  |

## Compressed 24-bit down-/upload

When downloading a Move program / a camshaft table, those items are transferred with a DLD_CONT command for an 8-bit command / data sample and a 24-bit date entry / position entry:

## Move program table (Type 01)

| Step | MB2 | MB3 | MB4 | MB5 |
| :--- | :--- | :--- | :--- | :--- |
| 1 | Command 1 | Data 1 (LSB) | Data 1 | Data 1 (MSB) |
| 2 | Command 2 | Data 2 (LSB) | Data 2 | Data 2 (MSB) |
| $\ldots$ |  |  |  |  |

## Camshaft Table (Type 02)

| Step | MB2 | MB3 | MB4 | MB5 |
| :--- | :--- | :--- | :--- | :--- |
| 1 | Bit sample 1 | Position 1 (LSB) | Position 1 | Position 1 (MSB) |
| 2 | Bit sample 2 | Position 2 (LSB) | Position 2 | Position 2 (MSB) |
| $\ldots$ |  |  |  |  |

Only 32-bit data exists for the position tables (Type 03) and the configuration data set (Type 04). Therefore, only the 32-bit down-/upload are given for both types of tables.

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| MB4 | Data |  |  |  |  |  |  |  |
| MB5 | Data |  |  |  |  |  |  |  |
| Return Code | 0x00: |  | OK |  |  |  |  |  |
|  | 0x31: |  | Upload/Download not started, or all data have already been transferred |  |  |  |  |  |
|  | 0x38: |  | Transferred data set corrupt |  |  |  |  |  |

### 4.2.4.3.3 DLD_END (0x43)

## End of Download

The download is completed and the stepper module checks the checksum. If the checksum is not OK, the table is invalid and can not be activated. The checksum is the sum of all data transferred with DLD_CONT. Summation is performed at 8 bits, with the 4 bytes that were transferred with DLD_CONT each being taken as 8 -bit values. The difference between the sum of all transferred data and the checksum must therefore be zero. The request data are ignored for an upload. If a configuration table is transferred, saving to EEPROM is performed automatically (but only when saving has been completed successfully), with a subsequent warm start (even if the transfer was faulted) that re-initializes all software modules.
The Reset status bit is set after the warm start; this must be canceled using Reset_Quit.
Only then is the module operational again.
After a successful download of a Move program to RAM Table 1, that table is automatically activated. (only when no other table is active however, see also TABLE_START)

| Request |  |  |  |  |  |  |  |  |

|  | 0x31: General |  |  |  |  |  |  |  |

### 4.2.4.4 Table Management Commands

### 4.2.4.4.1 TABLE_ERASE (0x44)

Tables are deleted by setting their status to invalid. An active table can not be deleted. A table can not be deleted during ongoing transfer using DLD_START, DLD_CONT or DLD_END.

Deleting of an EEPROM table is performed in the background, independently of processing of the table command (see also DIAG_QUERY_STORAGE). The "FACTORY_DEFAULT" configuration contained in the EEPROM can not be deleted (not even when using 255 as byte 2). "FACTORY_DEFAULT" may only be overwritten.

| Response |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2{ }^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |
| MB0 | 0x44 |  |  |  |  |  |  |  |
| MB1 | T | Return Code |  |  |  |  |  |  |
| MB2 | Status |  |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 | Reserved |  |  |  |  |  |  |  |

WAGO-I/O-SYSTEM 750 I/O Modules

### 4.2.4.4.2 TABLE_COPY ( $0 \times 45$ )

Tables will be copied.
The target may not be identical to the source.
A table can not be specified either as the target nor as the source of the copying command when transfer using DLD_START, DLD_CONT or DLD_END has not been completed. Writing of the EEPROM is performed in the background, independent of processing of the table command (see also DIAG_QUERY_STORAGE).

The tables located in the EEPROM are always copied to RAM 1 when the system is started up. This command can not be used for copying out of the EEPROM.

A configuration table can not be copied with this command (see also CFG_SAVE, CONFIG_RESTORE).

## Copying options:

1. RAM $\rightarrow$ RAM
2. RAM $\rightarrow$ EERPOM

| Response |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |
| MB0 | 0x44 |  |  |  |  |  |  |  |
| MB1 | T | Return Code |  |  |  |  |  |  |
| MB2 | Status |  |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 | Reserved |  |  |  |  |  |  |  |
| Return Code | 0x00: OK |  |  |  |  |  |  |  |
|  | $0 \times 31$ : |  | General error |  |  |  |  |  |
|  | 0x33: |  | Copying process still active |  |  |  |  |  |
|  | 0x34: |  | EEPROM copying process aborted |  |  |  |  |  |
|  | 0x35: |  | Target table not empty |  |  |  |  |  |
| Status | 0 : |  | Successfully copied |  |  |  |  |  |
|  | 1: |  | Copying aborted |  |  |  |  |  |

### 4.2.4.4.3 TABLE_START (0x46)

Activates a table Only a valid table can be activated (transfer using DLD_START, DLD_CONT and DLD_END completed successfully and checksum valid). This command can only be used after the Move program has been stopped.

| Response |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |

| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 | Reserved |  |  |  |  |  |  |  |
| Return <br> Code | 0x00: OK |  |  |  |  |  |  |  |

### 4.2.4.5.3 DIAG_RD_VAR (0x4C)

Read out status variable. The variable number determines the source to be read from.

| Response |  |  |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| MB0 | 0x4C |  |  |  |  |  |  |  |
| MB1 | T | Return Code |  |  |  |  |  |  |
| MB2 | Variable (LSB) |  |  |  |  |  |  |  |
| MB3 | Variable |  |  |  |  |  |  |  |
| MB4 | Variable |  |  |  |  |  |  |  |
| MB5 | Variable (MSB) |  |  |  |  |  |  |  |
| Return <br> Code | 0x00: OK |  |  |  |  |  |  |  |

### 4.2.4.5.4 DIAG_RD_BIT (0x4D)

Read out status bit (see also chapter 4.5, "Bit Field for I/O Driver").

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |
| MB0 | 0x4D |  |  |  |  |  |  |  |
| MB1 | T | - |  |  |  |  |  |  |
| MB2 | Bit number |  |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 | Reserved |  |  |  |  |  |  |  |

Bit number $0 \ldots 255$ : Specifies which predefined bit is being requested.

### 4.2.4.5.5 DIAG_QUERY_STORAGE (0x4E)

Read out storage process status bit

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| MB0 | 0x4E |  |  |  |  |  |  |  |
| MB1 | T | Reserved |  |  |  |  |  |  |
| MB2 | Reserved |  |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 |  |  |  |  |  |  |  |  |

| Response |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |
| MB0 | 0x4E |  |  |  |  |  |  |  |
| MB1 | T | Return Code |  |  |  |  |  |  |
| MB2 | Status |  |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 | Reserved |  |  |  |  |  |  |  |
| Return Code | 0x00: |  | OK |  |  |  |  |  |
| Status | 0 : |  | Storing completed |  |  |  |  |  |
|  | $1 . . .255$ |  | Storing in progress |  |  |  |  |  |

### 4.2.4.6 Configuration Table Commands

### 4.2.4.6.1 CONFIG_SET_PTR ( $0 \times 50$ )

Set address for data access to the configuration, see chapter Fehler! Verweisquelle konnte nicht gefunden werden., "Fehler! Verweisquelle konnte nicht gefunden werden.". The specified address is the same as the byte address.

| Response |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |
| MB0 | 0x50 |  |  |  |  |  |  |  |
| MB1 | T | Return Code |  |  |  |  |  |  |
| MB2 | Reserved |  |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 | Reserved |  |  |  |  |  |  |  |
| Return Code | 0x00: OK |  |  |  |  |  |  |  |
|  | 0x23: Access denied; invalid number of by |  |  |  |  |  |  |  |

### 4.2.4.6.2 CONFIG_WR (0x51)

Write access to configuration value.

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |
| MB0 | 0x51 |  |  |  |  |  |  |  |
| MB1 | T | - |  |  |  |  |  |  |
| MB2 | Data (LSB) |  |  |  |  |  |  |  |
| MB3 | Data |  |  |  |  |  |  |  |
| MB4 | Data |  |  |  |  |  |  |  |
| MB5 | Data (MSB) |  |  |  |  |  |  |  |

| Response |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2{ }^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |
| MB0 | 0x51 |  |  |  |  |  |  |  |
| MB1 | T | Return Code |  |  |  |  |  |  |
| MB2 | Reserved |  |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 | Reserved |  |  |  |  |  |  |  |
| Return | $0 \times 00$ |  |  | OK |  |  |  |  |
| Code |  |  |  | Access denied |  |  |  |  |  |

### 4.2.4.6.3 CONFIG_RD (0x52)

Read access to configuration value. The value 0 is returned when invalid access size specified.

### 4.2.4.6.4 CONFIG_SAVE (0x53)

Saves the current RAM configuration in the EEPROM. The configuration is saved as a user data set in the EEPROM with password 0x0001. The configuration is saved as RACTORY_DEFAULT in the EEPROM with password 0xE17E. At the same time, EEPROM sectors of the module registry set are also saved. A FACTORY_DEFAULT data set that has been saved can never be deleted again, only overwritten. This function does not wait for the saving process to be completed. This can be determined with DIAG_QUERY_STORAGE. Complete activation of the saved data set is conducted only after a (manual) restart of the module.
The Reset status bit is set after the warm start; this must be canceled using Reset_Quit.
Only then is the module operational again.

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Return Code | 0x00: |  | OK |  |  |  |  |  |
|  | 0x31: |  | Fault |  |  |  |  |  |

### 4.2.4.6.5 CONFIG_RESTORE (0x54)

The configuration is restored and the user data set overwritten. A warm start is carried out after the command has been successfully executed to ensure that all data is accepted.

Warning
During warm start the mailbox data are undefined. They may be evaluated only again if the status bit Reset signals the end of warm start.

### 4.3 Commands for Move Mode

### 4.3.1 Overview of Commands for Move Mode

| Function | Opcode | Meaning | Page |
| :---: | :---: | :---: | :---: |
| Setpoint commands |  |  |  |
| MOVE | 0x02 | Each MOVE command initiates a positioning process. | 193 |
| MOVE_IMMEDIATE | 0x03 | Each MOVE command initiates a positioning process. | 194 |
| MOVE_TABLE | 0x04 | Each MOVE command initiates a positioning process. | 195 |
| MOVE_TABLE IMMEDIATE | 0x05 | Each MOVE command initiates a positioning process. | 196 |
| MOVE_REL | 0x06 | Each MOVE command initiates a positioning process. | 197 |
| MOVE_TABLE_REL | 0x08 | Each MOVE command initiates a positioning process. | 198 |
| SPEED | 0x10 | SPEED commands run the drive to a speed.. | 199 |
| SPEED_IMMEDIATE | $0 \times 11$ | SPEED commands run the drive to a speed.. | 200 |
| STOP_FAST | 0x18 | SPEED commands run the drive to a speed.. | 201 |
| STOP_NO_RAMP | 0x19 | SPEED commands run the drive to a speed.. | 202 |
| TORQ | 0x1C | Each TORQ command begins a current setting (applies only to 750-673) | 203 |
| TORQ_IMM | 0x1D | Each TORQ command begins a current setting (applies only to 750-673) | 204 |
| START_REFERENCING | 0x20 | Starts a reference run. | 205 |
| SET_ACC_MODE | 0x21 | Sets the acceleration and decceleration mode. | 207 |
| SET_ACC | 0x22 | Sets acceleration and/or delay; valid as of the next positioning process. | 209 |
| SET_ACC_PARAM_UP | 0x23 | Set the Acc_ParamUp parameter for acceleration; valid as of the next positioning process. | 210 |
| $\begin{aligned} & \text { SET_ACC_PARAM_ } \\ & \text { DOWN } \end{aligned}$ | 0x24 | Set the Acc_ParamDown parameter for delay (deceleration); valid as of the next positioning process. | 211 |
| SET_VELOCITY | 0x25 | Sets the positioning speed; valid as of the next positioning process. | 212 |

| Function | Opcode | Meaning | Page |
| :---: | :---: | :---: | :---: |
| SET_VELOCITY_ <br> TARGET | 0x2B | Velocity to target position. Valid only for the next positioning process and is then reset automatically to zero after the next positioning process. | 213 |
| SET_ACTUALPOSITON | 0x2E | The current position is applied to the transferred value. | 214 |
| $\begin{aligned} & \text { SET_ACTUALPOSITION_ } \\ & \text { ZERO } \end{aligned}$ | 0x2F | The current position is set to zero | 215 |
| SET_CURRENT | 0x39 | Sets the motor current for drive movement. | 216 |
| Mathematic commands |  |  |  |
| VAR_SET | 0x50 | Sets one of the variables FILT1 ... FILT8 to the specified value | 217 |
| VAR_INC | 0x51 | Adds the specified value to one of the variables FILT1 ... FILT8. | 218 |
| VAR_DEC | 0x52 | Subtracts the specified value from one of the variables FILT1 ... FILT8. | 219 |
| VAR_ADD | 0x53 | Adds two variables and writes the result to a third variable | 220 |
| VAR_SUB | 0x54 | Subtracts two variables and writes the results to a third variable | 221 |
| VAR_MUL | 0x55 | Multiplies one variable by another one and writes the results to a third variable | 222 |
| VAR_COPY | 0x56 | Copes one variable to another variable. | 223 |
| VAR_DIV | 0x57 | Divides one variable by another one and writes the results to a third variable. | 224 |
| WAIT_TIME | 0x70 | Waits a defined time period before processing the next command. | 225 |
| WAIT_TEST_BIT | 0x71 | Before processing the next command waits until the specified bit has the status 0 or 1 . | 226 |
| Auxiliary commands |  |  |  |
| WR_BIT | 0x78 | Sets a bit to 0 or 1 . | 227 |
| NOP | 0xF0 | No function | 228 |
| PROG_STOP | 0xF1 | Ends table processing. | 229 |
| PROG_END | $\begin{aligned} & 0 \times 00 \text { or } \\ & 0 \times F F \end{aligned}$ | End of table. | 230 |
| GOTO | 0xF5 | Continues table process at the addressed entry. | 231 |
| GOTO_IF | 0xF6 | If a bit has been set, table processing is continued at the addressed entry; otherwise from the next entry. | 232 |

WAGO-I/O-SYSTEM 750
I/O Modules

| Function | Opcode | Meaning | Page |
| :--- | :--- | :--- | :--- |
| GOTO_IF_NOT | $0 x F 7$ | If a bit has been deleted, table <br> processing is continued at the addressed <br> entry; otherwise from the next entry. | 233 |
| GOTO_LABEL | $0 x F 8$ | Continues table process from a defined <br> label. | 234 |
| GOTO_LABEL_IF | $0 x F 9$ | Continues table processing for a defined <br> label if a bit has been set. | 235 |
| GOTO_LABEL_IF_NOT | 0xFA | Continues table processing for a defined <br> label if a bit has been deleted. | 236 |
| LABEL | 0xFB | Defines a label for a step target | 237 |

### 4.3.2 Overview of Move Mode Commands, Sorted by Opcodes

| Function | Opcode | Meaning | Page |
| :---: | :---: | :---: | :---: |
| PROG_END | $\begin{aligned} & 0 \times 00 \text { or } \\ & 0 \times F F \end{aligned}$ | End of table. | 230 |
| MOVE | 0x02 | Each MOVE command initiates a positioning process. | 193 |
| MOVE_IMMEDIATE | 0x03 | Each MOVE command initiates a positioning process. | 194 |
| MOVE_TABLE | 0x04 | Each MOVE command initiates a positioning process. | 195 |
| MOVE_TABLE IMMEDIATE | 0x05 | Each MOVE command initiates a positioning process. | 196 |
| MOVE_REL | 0x06 | Each MOVE command initiates a positioning process. | 197 |
| MOVE_TABLE_REL | 0x08 | Each MOVE command initiates a positioning process. | 198 |
| SPEED | 0x10 | SPEED commands run the drive to a speed.. | 199 |
| SPEED_IMMEDIATE | 0 x 11 | SPEED commands run the drive to a speed.. | 200 |
| STOP_FAST | 0x18 | SPEED commands run the drive to a speed.. | 201 |
| STOP_NO_RAMP | 0x19 | SPEED commands run the drive to a speed.. | 202 |
| TORQ | 0x1C | Each TORQ command begins a current setting (applies only to 750-673) | 203 |
| TORQ_IMM | 0x1D | Each TORQ command begins a current setting (applies only to 750-673) | 204 |
| START_REFERENCING | 0x20 | Starts a reference run. | 205 |
| SET_ACC_MODE | 0x21 | Sets the acceleration and decceleration mode. | 207 |
| SET_ACC | 0x22 | Sets acceleration and/or delay; valid as of the next positioning process. | 209 |
| SET_ACC_PARAM_UP | 0x23 | Set the Acc_ParamUp parameter for acceleration; valid as of the next positioning process. | 210 |
| SET_ACC_PARAM_ DOWN | 0x24 | Set the Acc_ParamDown parameter for delay (deceleration); valid as of the next positioning process. | 211 |
| SET_VELOCITY | 0x25 | Sets the positioning speed; valid as of the next positioning process. | 212 |
| SET_VELOCITY_ <br> TARGET | 0x2B | Velocity to target position. Valid only for the next positioning process and is then reset automatically to zero after the next positioning process. | 213 |

WAGO-I/O-SYSTEM 750
I/O Modules

| Function | Opcode | Meaning | Page |
| :---: | :---: | :---: | :---: |
| SET_ACTUALPOSITON | 0x2E | The current position is applied to the transferred value. | 214 |
| SET_ACTUALPOSITION ZERO | 0x2F | The current position is set to zero | 215 |
| SET_CURRENT | 0x39 | Sets the motor current for drive movement. | 216 |
| VAR_SET | 0x50 | Sets one of the variables FILT1 ... <br> FILT8 to the specified value | 217 |
| VAR_INC | 0x51 | Adds the specified value to one of the variables FILT1 ... FILT8. | 218 |
| VAR_DEC | 0x52 | Subtracts the specified value from one of the variables FILT1 ... FILT8. | 219 |
| VAR_ADD | 0x53 | Adds two variables and writes the result to a third variable | 220 |
| VAR_SUB | 0x54 | Subtracts two variables and writes the results to a third variable. | 221 |
| VAR_MUL | 0x55 | Multiplies one variable by another one and writes the results to a third variable. | 222 |
| VAR_COPY | 0x56 | Copes one variable to another variable. | 223 |
| VAR_DIV | 0x57 | Divides one variable by another one and writes the results to a third variable. | 224 |
| WAIT_TIME | 0x70 | Waits a defined time period before processing the next command. | 225 |
| WAIT_TEST_BIT | 0x71 | Before processing the next command waits until the specified bit has the status 0 or 1 . | 226 |
| WR_BIT | 0x78 | Sets a bit to 0 or 1 . | 227 |
| NOP | 0xF0 | No function | 228 |
| PROG_STOP | 0xF1 | Ends table processing. | 229 |
| GOTO | 0xF5 | Continues table process at the addressed entry. | 231 |
| GOTO_IF | 0xF6 | If a bit has been set, table processing is continued at the addressed entry; otherwise from the next entry. | 232 |
| GOTO_IF_NOT | 0xF7 | If a bit has been deleted, table processing is continued at the addressed entry; otherwise from the next entry. | 233 |
| GOTO_LABEL | 0xF8 | Continues table process from a defined label. | 234 |
| GOTO_LABEL_IF | 0xF9 | Continues table processing for a defined label if a bit has been set. | 235 |
| GOTO_LABEL_IF_NOT | 0xFA | Continues table processing for a defined label if a bit has been deleted. | 236 |
| LABEL | 0xFB | Defines a label for a step target | 237 |

### 4.3.3 Overview of Move Mode Commands, Sorted by Function

| Function | Opcode | Meaning | Page |
| :---: | :---: | :---: | :---: |
| GOTO | 0xF5 | Continues table process at the addressed entry. | 231 |
| GOTO_IF | 0xF6 | If a bit has been set, table processing is continued at the addressed entry; otherwise from the next entry. | 232 |
| GOTO_IF_NOT | 0xF7 | If a bit has been deleted, table processing is continued at the addressed entry; otherwise from the next entry. | 233 |
| GOTO_LABEL | 0xF8 | Continues table process from a defined label. | 234 |
| GOTO_LABEL_IF | 0xF9 | Continues table processing for a defined label if a bit has been set. | 235 |
| GOTO_LABEL_IF_NOT | 0xFA | Continues table processing for a defined label if a bit has been deleted. | 236 |
| LABEL | 0xFB | Defines a label for a step target | 237 |
| MOVE | 0x02 | Each MOVE command initiates a positioning process. | 193 |
| MOVE_IMMEDIATE | 0x03 | Each MOVE command initiates a positioning process. | 194 |
| MOVE_REL | 0x06 | Each MOVE command initiates a positioning process. | 197 |
| MOVE_TABLE | 0x04 | Each MOVE command initiates a positioning process. | 195 |
| MOVE_TABLE_ IMMEDIATE | 0x05 | Each MOVE command initiates a positioning process. | 196 |
| MOVE_TABLE_REL | 0x08 | Each MOVE command initiates a positioning process. | 198 |
| NOP | 0xF0 | No function | 228 |
| PROG_END | 0x00 or $0 x F F$ | End of table. | 230 |
| PROG_STOP | 0xF1 | Ends table processing. | 229 |
| SET_ACC | 0x22 | Sets acceleration and/or delay; valid as of the next positioning process. | 209 |
| SET_ACC_MODE | 0x21 | Sets the acceleration and decceleration mode. | 207 |
| SET_ACC_PARAM_ DOWN | 0x24 | Set the Acc_ParamDown parameter for delay (deceleration); valid as of the next positioning process. | 211 |
| SET_ACC_PARAM_UP | 0x23 | Set the Acc_ParamUp parameter for acceleration; valid as of the next positioning process. | 210 |

WAGO-I/O-SYSTEM 750
I/O Modules

| Function | Opcode | Meaning | Page |
| :---: | :---: | :---: | :---: |
| SET_ACTUALPOSITION ZERO | 0x2F | The current position is set to zero | 215 |
| SET_ACTUALPOSITON | 0x2E | The current position is applied to the transferred value. | 214 |
| SET_CURRENT | 0x39 | Sets the motor current for drive movement. | 216 |
| SET_VELOCITY | 0x25 | Sets the positioning speed; valid as of the next positioning process. | 212 |
| SET_VELOCITY_ <br> TARGET | 0x2B | Velocity to target position. Valid only for the next positioning process and is then reset automatically to zero after the next positioning process. | 213 |
| SPEED | 0x10 | SPEED commands run the drive to a speed.. | 199 |
| SPEED_IMMEDIATE | 0x11 | SPEED commands run the drive to a speed.. | 200 |
| START_REFERENCING | 0x20 | Starts a reference run. | 205 |
| STOP_FAST | 0x18 | SPEED commands run the drive to a speed.. | 201 |
| STOP_NO_RAMP | 0x19 | SPEED commands run the drive to a speed.. | 202 |
| TORQ | 0x1C | Each TORQ command begins a current setting (applies only to 750-673) | 203 |
| TORQ_IMM | 0x1D | Each TORQ command begins a current setting (applies only to 750-673) | 204 |
| VAR_ADD | 0x53 | adds two variables and writes the result to a third variable | 220 |
| VAR_COPY | 0x56 | Copes one variable to another variable. | 223 |
| VAR_DEC | 0x52 | Subtracts the specified value from one of the variables FILT1 ... FILT8. | 219 |
| VAR_DIV | 0x57 | Divides one variable by another one and writes the results to a third variable. | 224 |
| VAR_INC | 0x51 | Adds the specified value to one of the variables FILT1 ... FILT8. | 218 |
| VAR_MUL | 0x55 | Multiplies one variable by another one and writes the results to a third variable. | 222 |
| VAR_SET | 0x50 | Sets one of the variables FILT1 ... FILT8 to the specified value | 217 |
| VAR_SUB | 0x54 | Subtracts two variables and writes the results to a third variable. | 221 |
| WAIT_TEST_BIT | 0x71 | Before processing the next command waits until the specified bit has the status 0 or 1 . | 226 |

| Function | Opcode | Meaning | Page |
| :--- | :--- | :--- | :--- |
| WAIT_TIME | $0 \times 70$ | Waits a defined time period before <br> processing the next command. | 225 |
| WR_BIT | $0 \times 78$ | Sets a bit to 0 or 1. | 227 |

### 4.3.4 Reference Commands for Move Mode

### 4.3.4.1 Set point commands

### 4.3.4.1.1 MOVE (0x02)

Starts a positioning process. This command immediately deletes the "On_Target" bit and sets that bit when the target position is reached. This command is accepted only when the last positioning process has been completed and the "On_Target" bit has been set. The acceleration and velocity specified by SET_ACC (0x22) and SET_VELOCITY (0x25) are used for positioning commands.

### 4.3.4.1.2 MOVE_IMMEDIATE (0x03)

Starts a positioning process. This command immediately deletes the "On_Target" bit and sets that bit when the target position is reached. This command will interrupt any positioning process that may already be in progress and immediately starts a new positioning process. The acceleration and velocity specified by SET_ACC (0x22) and SET_VELOCITY (0x25) are used for positioning commands.

### 4.3.4.1.3 MOVE_TABLE (0x04)

Starts a positioning process. This command immediately deletes the "On_Target" bit and sets that bit when the target position is reached. This command is accepted only when the last positioning process has been completed and the "On_Target" bit has been set. This command reads the target position from the specified location in a separate position table. The acceleration and velocity specified by SET_ACC ( $0 \times 22$ ) and SET_VELOCITY ( $0 \times 25$ ) are used for positioning commands.

### 4.3.4.1.4 MOVE_TABLE_IMMEDIATE (0x05)

Starts a positioning process. This command immediately deletes the "On_Target" bit and sets that bit when the target position is reached. This command will interrupt any positioning process that may already be in progress and immediately starts a new positioning process. This command reads the target position from the specified location in a separate position table. The acceleration and velocity specified by SET_ACC ( $0 \times 22$ ) and SET_VELOCITY (0x25) are used for positioning commands.

### 4.3.4.1.5 MOVE_REL (0x06)

Starts a positioning process. This command immediately deletes the "On_Target" bit and sets that bit when the target position is reached. This command is accepted only when the last positioning process has been completed and the "On_Target" bit has been set. This command calculates the target position relative to the last accepted target (if available), or to the current position. The acceleration and velocity specified by SET_ACC (0x22) and SET_VELOCITY ( $0 \times 25$ ) are used for positioning commands.

| Request |  |  |  |  |  |  |  |  |

| MB5 |  |  |  |  |  |  |  |  |

### 4.3.4.1.6 MOVE_TABLE_REL (0x08)

Starts a positioning process. This command immediately deletes the "On_Target" bit and sets that bit when the target position is reached. This command is accepted only when the last positioning process has been completed and the "On_Target" bit has been set. This command reads the target position from the specified location in a separate position table. This command calculates the target position relative to the last accepted target (if available), or to the current position. The acceleration and velocity specified by SET_ACC (0x22) and SET_VELOCITY (0x25) are used for positioning commands.

| Request |  |  |  |  |  |  |  |  |

### 4.3.4.1.7 SPEED ( $0 \times 10$ )

Runs the drive up to a defined speed. On execution of this command, the "On_Target" bit is deleted immediately and then set when the target speed is reached. This command does NOT set the positioning speed! SET_VELOCITY ( $0 \times 25$ ) must be used for that. The SPEED command is accepted only when the last process has been completed and the "On_Target" bit has been set.

Velocity range: -25000 ... 25000.

| Request |  |  |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| MB5 | Reserved |  |  |  |  |  |  |  |

### 4.3.4.1.8 SPEED_IMMEDIATE (0x11)

Runs the drive up to a defined speed. On execution of this command, the "On_Target" bit is deleted immediately and then set when the target speed is reached. This command does NOT set the positioning speed! SET_VELOCITY ( $0 \times 25$ ) must be used for that. This command will interrupt any process that may already be in operation and immediately starts speed control.

Velocity range: -25000 ... 25000.

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| MB5 |  |  |  |  |  |  |  |  |

### 4.3.4.1.9 STOP_FAST (0x18)

Brakes the drive directly with the acceleration command SET_ACC_STOP down to standstill. The internal processing has been designed for this command to be processed in priority. Especially in mailbox mode, every other command is cancelled immediately. This command is also initiated internally when a stop condition is present, such as limit switch or stop input.

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| MB5 |  |  |  |  |  |  |  |  |

### 4.3.4.1.10 STOP_NO_RAMP (0x19)

Sets the output frequency immediately to zero. The internal processing has been designed for this command to be processed in priority. Especially in mailbox mode, every other command is cancelled immediately. This command has priority over STOP_FAST. This command is also triggered internally, if release is not set.

| Request |  |  |  |  |  |  |  |  |

### 4.3.4.1.11 TORQ (0x1C)

This function exists at servo stepper controller 750-673.
Begins a current setting. The speed regulator is given a target velocity. As long as the target velocity is not achieved, the current setpoint generates a torque whose sign depends on the speed error.
If the target velocity is achieved, the speed regulator will automatically reduce the current. Because the current is regulated immediately, the bit "On_Target" is set immediately.
This command is accepted only when the last positioning process has been completed and the "On_Target" bit has been set.

Velocity range: -25000 ... 25000.

| Request |  |  |  |  |  |  |  |  |

### 4.3.4.1.13 START_REFERENCING ( $0 \times 20$ )

This function exists at servo stepper controller 750-673.
Starts a reference run. This command immediately deletes the bits On_Target and Reference_OK. When the reference point is reached, Reference_OK is set. The On_Target bit is not set. The Busy bit is set during a reference run.

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |

| MB5 |  |  |  |  |  |  |  |  |

### 4.3.4.1.16 SET_ACC_PARAM_UP (0x23)

Set the Acc_ParamUp parameter for acceleration; valid as of the next positioning process.

The function for the acceleration parameter as a function of the set acceleration modification is shown in the following table.

| Acceleration modification <br> (SET_ACC_MODE $\rightarrow$ ACC_M) | Acceleration parameter <br> Acc_ParamUp |
| :--- | :--- |
| none | Time constant for acceleration increase <br> with linear or $\sin ^{2}{ }^{2}$ t acceleration |
| constant acceleration period | Acceleration time |
| constant acceleration path | Acceleration path |

Acceleration parameter range: 1-16777215.

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |

| MB5 |  |  |  |  |  |  |  |  |

### 4.3.4.1.17 SET_ACC_PARAM_DOWN (0x24)

Set the Acc_ParamDown parameter for delay (deceleration); valid as of the next positioning process.

The function for the delay parameter as a function of the set delay modification is shown in the following table.

| Deceleration modification <br> (SET_ACC_MODE $\rightarrow$ DEC_M) | Delay parameter <br> Acc_ParamDown |
| :--- | :--- |
| none | Time constant for decceleration increase with <br> linear or $\sin ^{2} *$ t deceleration |
| constant delay period | Delay time |
| constant delay path | Delay path |

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{7}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| MB0 | $\mathbf{0 x 4 0}$ |  |  |  |  |  |  |  |
| MB1 | T |  |  |  |  |  |  |  |
| MB2 | $\mathbf{0 x}$ |  |  |  |  |  |  |  |
| MB3 | Decceleration parameter (LSB) |  |  |  |  |  |  |  |
| MB4 | Decceleration parameter |  |  |  |  |  |  |  |
| MB5 | Decceleration parameter (MSB) |  |  |  |  |  |  |  |

| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 | Reserved |  |  |  |  |  |  |  |

### 4.3.4.1.18 SET_VELOCITY (0x25)

Sets the positioning velocity; valid as of the next positioning command (see also positioning commands MOVE..., 0x02, 0x03, 0x04, 0x05, 0x06, 0x08)

Velocity range: 1 .. 25000.

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| MB0 | $\mathbf{0 x 4 0}$ |  |  |  |  |  |  |  |
| MB1 | T | Velocity (LSB) |  |  |  |  |  |  |
| MB2 | Velocity (MSB) |  |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 |  |  |  |  |  |  |  |  |
| MB5 |  |  |  |  |  |  |  |  |

| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| 0x40 |  |  |  |  |  |  |  |  |
| MB0 | Return Code |  |  |  |  |  |  |  |
| MB1 | T | 0x25 |  |  |  |  |  |  |
| MB2 | Reserved |  |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 |  |  |  |  |  |  |  |  |

### 4.3.4.1.19 SET_VELOCITY_TARGET (0x2B)

Sets the target velocity for the next positioning process. The target velocity is automatically reset to zero after the next positioning process.

Velocity range: 1 .. 25000.

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| MB0 | $\mathbf{0 x 4 0}$ |  |  |  |  |  |  |  |
| MB1 | T | Velocity (LSB) |  |  |  |  |  |  |
| MB2 | Velocity (MSB) |  |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 |  |  |  |  |  |  |  |  |
| MB5 |  |  |  |  |  |  |  |  |

| Response |  |  |  |  |  |  |  |  |

| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 |  |  |  |  |  |  |  |  |

### 4.3.4.1.20 SET_ACTUALPOSITON (0x2E)

The current position is set to the transferred value. For this, the logical point Zero is modified accordingly.

The position is given as a 24 -bit value, including sign.

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| MB0 | $\mathbf{0 x 4 0}$ |  |  |  |  |  |  |  |
| MB1 | T | Position (LSB) |  |  |  |  |  |  |
| MB2 | Position |  |  |  |  |  |  |  |
| MB3 |  |  |  |  |  |  |  |  |
| MB4 |  |  |  |  |  |  |  |  |
| MB5 |  |  |  |  |  |  |  |  |

| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 |  |  |  |  |  |  |  |  |

### 4.3.4.1.22 SET_CURRENT (0x39)

Sets the motor current for drive movement.
The corresponding bit in the valid range must be set to 1 for the working range for which the motor current is to be set. Several bits may be set simultaneously. If the corresponding bit is set to 0 , the value for the motor current valid up to then is retained for this range.

Motor current range: $0 \ldots 150 \%$ module rated current

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | 2 |

| MB5 |  |  |  |  |  |  |  |  |  |  |  |  |

### 4.3.4.2.3 VAR_DEC (0x52)

Subtracts the given value from a variable.

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |
| MB0 | 0x40 |  |  |  |  |  |  |  |
| MB1 | T | - |  |  |  |  |  |  |
| MB2 | 0x52 |  |  |  |  |  |  |  |
| MB3 | $1 \ldots 8$ (corresponds to FILT1 ... FILT8) |  |  |  |  |  |  |  |
| MB4 | 16 bit value (LSB) |  |  |  |  |  |  |  |
| MB5 | 16 bit value (MSB) |  |  |  |  |  |  |  |

| Response |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| 0x40 |  |  |  |  |  |  |  |  |
| MB0 | Return Code |  |  |  |  |  |  |  |
| MB2 | T | 0x52 |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 |  |  |  |  |  |  |  |  |

### 4.3.4.2.4 VAR_ADD (0x53)

Adds two variables and writes the results to a third variable.

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| MB0 |  |  |  |  |  |  |  |  |
| MB1 | T | $\mathbf{0 x 5 3}$ |  |  |  |  |  |  |
| MB2 |  |  |  |  |  |  |  |  |
| MB3 | Result $(1 \ldots 8$ corresponds to FILT1 $\ldots$ FILT8 $)$ |  |  |  |  |  |  |  |
| MB4 | Summand $2(1 \ldots 8$ corresponds to FILT1 $\ldots$ FILT8) |  |  |  |  |  |  |  |
| MB5 | Summand $1(1 \ldots 8$ corresponds to FILT1 $\ldots$ FILT8 $)$ |  |  |  |  |  |  |  |

| Response |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| MB0 | Return Code |  |  |  |  |  |  |  |
| MB1 | T |  |  |  |  |  |  |  |
| MB2 | 0x53 |  |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 |  |  |  |  |  |  |  |  |

### 4.3.4.2.5 VAR_SUB ( $0 \times 54$ )

Subtracts one variable from another one and writes the results to a third variable.

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| MB0 | $\mathbf{0 \times 4 0}$ |  |  |  |  |  |  |  |
| MB1 | T | $\mathbf{0 x 5 4}$ |  |  |  |  |  |  |
| MB2 |  |  |  |  |  |  |  |  |
| MB3 | Difference $(1 \ldots 8$ corresponds to FILT1 $\ldots$ FILT8) |  |  |  |  |  |  |  |
| MB4 | Minuend $(1 \ldots 8$ corresponds to FILT1 $\ldots$ FILT8) |  |  |  |  |  |  |  |
| MB5 | Subtrahend $(1 \ldots 8$ corresponds to FILT1 $\ldots$ FILT8) |  |  |  |  |  |  |  |

| Response |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |
| MB0 | 0x40 |  |  |  |  |  |  |  |
| MB1 | T | Return Code |  |  |  |  |  |  |
| MB2 | 0x54 |  |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 | Reserved |  |  |  |  |  |  |  |

### 4.3.4.2.6 VAR_MUL (0x55)

Multiplies one variable by another one and writes the results to a third variable.

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |
| MB0 | 0x40 |  |  |  |  |  |  |  |
| MB1 | T | - |  |  |  |  |  |  |
| MB2 | 0x55 |  |  |  |  |  |  |  |
| MB3 | Product ( $1 . .8$ corresponds to FILT1 ... FILT8) |  |  |  |  |  |  |  |
| MB4 | Multiplicand 2 ( $1 \ldots 8$ corresponds to FILT1 ... FILT8) |  |  |  |  |  |  |  |
| MB5 | Multiplicand 1 ( $1 \ldots 8$ corresponds to FILT1 $\ldots$ FILT8) |  |  |  |  |  |  |  |

| Response |  |  |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{7}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| MB0 | 0x40 |  |  |  |  |  |  |  |
| MB1 | T | Return Code |  |  |  |  |  |  |
| MB2 | Reserved |  |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 |  |  |  |  |  |  |  |  |

### 4.3.4.2.7 VAR_COPY (0x56)

Copes one variable to another variable.

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |
| MB0 | 0x40 |  |  |  |  |  |  |  |
| MB1 | T | - |  |  |  |  |  |  |
| MB2 | 0x56 |  |  |  |  |  |  |  |
| MB3 | Target ( $1 . .8$ corresponds to FILT1 ... FILT8) |  |  |  |  |  |  |  |
| MB4 | Source ( $1 . .8$ corresponds to FILT1 ... FILT8) |  |  |  |  |  |  |  |
| MB5 | Reserved |  |  |  |  |  |  |  |

| Response |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| 0x40 |  |  |  |  |  |  |  |  |
| MB0 | Return Code |  |  |  |  |  |  |  |
| MB2 | T | 0x56 |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 |  |  |  |  |  |  |  |  |

### 4.3.4.2.8 VAR_DIV (0x57)

Divides one variable by another one and writes the results to a third variable.

| Request |  |  |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| MB0 |  |  |  |  |  |  |  |  |
| MB1 | T | $\mathbf{0 x 5 7}$ |  |  |  |  |  |  |
| MB2 |  |  |  |  |  |  |  |  |
| MB3 | Quotient $(1 \ldots 8$ corresponds to FILT1 $\ldots$ FILT8) |  |  |  |  |  |  |  |
| MB4 | Dividend $(1 \ldots 8$ corresponds to FILT1 $\ldots$ FILT8) |  |  |  |  |  |  |  |
| MB5 | Divisor $(1 \ldots 8$ corresponds to FILT1 $\ldots$ FILT8) |  |  |  |  |  |  |  |

| Response |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{7}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| MB0 |  |  |  |  |  |  |  |  |
| MB1 | T | Return Code |  |  |  |  |  |  |
| MB2 | 0x57 |  |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 | Reserved |  |  |  |  |  |  |  |

### 4.3.4.3 Wait Commands

### 4.3.4.3.1 WAIT_TIME ( $0 \times 70$ )

Waits for some time before processing the next command
Waiting time range: $0 \ldots 16777215 \mathrm{~ms}$.

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |
| MB0 | 0x40 |  |  |  |  |  |  |  |
| MB1 | T | - |  |  |  |  |  |  |
| MB2 | 0x70 |  |  |  |  |  |  |  |
| MB3 | Waiting time (LSB) |  |  |  |  |  |  |  |
| MB4 | Waiting time |  |  |  |  |  |  |  |
| MB5 | Waiting time (MSB) |  |  |  |  |  |  |  |

| Response |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| MB0 | Return Code |  |  |  |  |  |  |  |
| MB1 | T | 0x70 |  |  |  |  |  |  |
| MB2 | Reserved |  |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 |  |  |  |  |  |  |  |  |

### 4.3.4.3.2 WAIT_TEST_BIT (0x71)

Before processing the next command waits until the specified bit has the specified status 0 or 1 .
Refer to chapter 4.5, "Bit Field for I/O Driver" for the bit number.

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| 0x40 |  |  |  |  |  |  |  |  |
| MB0 |  |  |  |  |  |  |  |  |
| MB1 | T | 0x71 |  |  |  |  |  |  |
| MB2 | Bit No. |  |  |  |  |  |  |  |
| MB3 | Specified status of bit (0 or 1) |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 |  |  |  |  |  |  |  |  |

| Response |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| MB0 | Return Code |  |  |  |  |  |  |  |
| MB1 | T | 0x71 |  |  |  |  |  |  |
| MB2 | Reserved |  |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 |  |  |  |  |  |  |  |  |

### 4.3.4.4 Auxiliary commands

### 4.3.4.4.1 WR_BIT (0x78)

Sets bit to 0 or 1 .
Refer to chapter 4.5, „Bit Field for I/O Driver" for the bit number.

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |
| MB0 | 0x40 |  |  |  |  |  |  |  |
| MB1 | T | - |  |  |  |  |  |  |
| MB2 | 0x78 |  |  |  |  |  |  |  |
| MB3 | Bit No. |  |  |  |  |  |  |  |
| MB4 | Specified status of bit (0 or 1) |  |  |  |  |  |  |  |
| MB5 | Reserved |  |  |  |  |  |  |  |

| Response |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| 0x40 |  |  |  |  |  |  |  |  |
| MB0 | Return Code |  |  |  |  |  |  |  |
| MB2 | T | 0x78 |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 |  |  |  |  |  |  |  |  |

### 4.3.4.4.2 NOP (0xFO)

Function not defined.

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| MB0 |  |  |  |  |  |  |  |  |
| MB1 | T |  |  |  |  |  |  |  |

| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 |  |  |  |  |  |  |  |  |

| Response |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| 0x40 |  |  |  |  |  |  |  |  |
| MB0 | Return Code |  |  |  |  |  |  |  |
| MB2 | T | 0xF0 |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 |  |  |  |  |  |  |  |  |

### 4.3.4.4.3 PROG_STOP (0xF1)

Ends the table processing. Sets speed to Zero, deactivates final step, ends table processing.

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2{ }^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |
| MB0 | 0x40 |  |  |  |  |  |  |  |
| MB1 | T | - |  |  |  |  |  |  |
| MB2 | 0xF1 |  |  |  |  |  |  |  |
| MB3 | Error message |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 | Reserved |  |  |  |  |  |  |  |
| Error message |  | 0 : | No error message |  |  |  |  |  |
|  |  | 1 ... 8: | Error message ERROR_TBL_PROGRAM_STOP1 ... 8 |  |  |  |  |  |
|  |  | 9 ... 255 | Reserved |  |  |  |  |  |

| Response |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| MB0 | 0x40 |  |  |  |  |  |  |  |
| MB1 | T | Return Code |  |  |  |  |  |  |
| MB2 | $\mathbf{0 x F 1}$ |  |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 |  |  |  |  |  |  |  |  |

### 4.3.4.4.4 PROG_END ( $0 \times 00$ or $0 x F F$ )

End of table (default command for a blank / deleted table). Sets speed to Zero, deactivates the final step, ends table processing and indicates an error ERR_PROG_END.

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| 0x40 |  |  |  |  |  |  |  |  |
| MB0 |  |  |  |  |  |  |  |  |
| MB1 | T | 0x00 or 0xFF |  |  |  |  |  |  |
| MB2 | Reserved |  |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 |  |  |  |  |  |  |  |  |

| Response |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| MB0 | Return Code |  |  |  |  |  |  |  |
| MB1 | T | $\mathbf{0 x 0 0}$ or 0xFF |  |  |  |  |  |  |
| MB2 | Reserved |  |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 |  |  |  |  |  |  |  |  |

### 4.3.4.4.5 GOTO (0xF5)

Continues table processing at the addressed entry.
Command number range: $1 \ldots 500$

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $\mathbf{2}^{\mathbf{7}}$ | $\mathbf{2}^{\mathbf{6}}$ | $\mathbf{2}^{\mathbf{5}}$ | $\mathbf{2}^{\mathbf{4}}$ | $\mathbf{2}^{\mathbf{3}}$ | $\mathbf{2}^{\mathbf{2}}$ | $\mathbf{2}^{\mathbf{1}}$ | $\mathbf{2}^{\mathbf{0}}$ |
| 0x40 |  |  |  |  |  |  |  |  |
| MB1 |  |  |  |  |  |  |  |  |
| MB1 | T | 0xF5 |  |  |  |  |  |  |

| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 |  |  |  |  |  |  |  |  |

### 4.3.4.4.11 LABEL (0xFB)

Defines a label as a step target for a GOTO command; no further function. If more than one identical label numbers are defined, the one at the lowest address in the table shall be valid.

Label number range: $1 \ldots 65536$

| Request |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |
| MB0 | 0x40 |  |  |  |  |  |  |  |
| MB1 | T | - |  |  |  |  |  |  |
| MB2 | 0xFB |  |  |  |  |  |  |  |
| MB3 | Label number (LSB) |  |  |  |  |  |  |  |
| MB4 | Label number (MSB) |  |  |  |  |  |  |  |
| MB5 | Reserved |  |  |  |  |  |  |  |

| Response |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |
| MB0 | 0x40 |  |  |  |  |  |  |  |
| MB1 | T | Return Code |  |  |  |  |  |  |
| MB2 | 0xFB |  |  |  |  |  |  |  |
| MB3 | Reserved |  |  |  |  |  |  |  |
| MB4 | Reserved |  |  |  |  |  |  |  |
| MB5 | Reserved |  |  |  |  |  |  |  |

### 4.4 Error Blink Codes

The errors and warnings of all subsystems are analyzed at a central location. The occurrence of errors and warnings is recorded and leads the device into an error condition.

In the case of error messages, the output stage is terminated immediately. The motor has no torque in this state and is at risk of uncontrolled movements, which can be prevented with an external brake.

The error or warning condition continues until the cause is remedied.

## Attention

The bit error (S2.7) follows statically the bit Error_Quit (C2.7). If the error cause is not eliminated, the bit Error_Quit is set again!

If no more errors or warnings are reported by the hardware, the error or warning condition can be acknowledged with the positive edge by the control bit Error_Quit or with a mailbox command DIAG_QUIT_ERROR.

The error message consists of a 4-digit number.

### 4.4.1 Error Codes 1111 through 1999

Error codes 1111 through 1999 are errors which can be confirmed by a simple acknowledgement.

### 4.4.2 Error Codes 2111 through 2999

Error codes 2111 through 2999 are errors which require a warm start of the module. This causes unsaved settings to be lost, requiring them to be reconfigured by the controller. This is indicated by the Reset status bit.

### 4.4.3 Error Codes 3111 through 3999

Error codes 3111 through 3999 are serious system errors which, for safety reasons, do not allow further operation of the module.
When such an error is reported, all further program processing is blocked and is branched to a routine, in which the error code is reported exclusively with LED A.
These errors require a reset of the module by switching it off and then switching it back on.
An error is indicated by the Error status bit.

### 4.4.4 Warning Codes 5111 through 5999

Warning codes 5111 through 5999 do not lead to an error condition--they are merely signaled.
A warning is indicated by the Warning status bit.

### 4.4.5 Signaling

The error display starts with the first blinking sequence (approx. 10 Hz ). Shortly afterward, the second blinking sequence starts (approx. 2 Hz ). This sequence represents the highest digit for the 4-place error code.
After a 1 second pause each, all other numbers appear down to the number with the lowest value.
Then, the flash sequence repeats.

### 4.4.6 Internal Data Bus Parameterization: Accumulative Diagnostics

Errors can also be reported in status byte S0, bit 6 (ERR) and thus initiate an acyclic diagnostics message.
This bit is addressed continuously as long as the error is present and Error_Quit is not set permanently.
Enabling for the indication is set using the configuration parameter ErrorNotificationMode.SystemFlagEnable (parameter 113, bit 0). This bit has the following meaning:

0: $\quad$ Errors are not reported via status byte S0, bit 6 (ERR).
1: $\quad$ Errors are reported via status byte S0, bit 6 (ERR).
Warning displays are enabled using the configuration parameter WarningNotificationMode.SystemFlagEnable (parameter 116, bit 0). This bit has the following meaning:

0: Warnings are not reported via status byte S0, bit 6 (ERR).
1: Warnings are reported via status byte S 0 , bit 6 (ERR).
An explanation of the individual error numbers is given in the following table.

### 4.4.7 Overview of Error Blink Codes

| Error No.: | Designation | Description | Possible cause/Solution |
| :---: | :---: | :---: | :---: |
| 1111 | CI UNKNOWN COMMAND | internal | Internal |
| 1112 | CI UNKNOWN COMMAND2 | Unknown command | A drive command was received with an unknown command. Check command (and possibly the run program). |
| 1113 | CI_ERR1 | Unknown command, like Error 1112 | Same as for Error 1112. |
| 1114 | CI_NOT <br> IMPLEMENTED | Command not implemented | Command has been prepared but has not (yet) been implemented, otherwise same as Error 1112. |
| 1115 | CI_COMMAND_DE NIED | Command could not be executed | It was not possible to execute a command, as the marginal conditions do not permit it. (incorrect mode, incorrect parameter, .... for this command) |
| 1116 | CI_SPEED1 | Configuration: maximum frequency invalid | Unacceptable value specified for maximum frequency. |
| 1117 | CI_SPEED2 | Frequency setting invalid | Unacceptable value specified for set frequency. |
| 1118 | CI_SPEED3 | internal | Internal |
| 1121 | CI_ACC1 | Acceleration value invalid | Check the specified acceleration value (configuration, Move program, process data ....). |
| 1122 | CI_ACC2 | Acceleration value invalid | Same as for Error 1121. |
| 1123 | CI <br> ROTARY_AXIS PERIOD_SETPOINT | Operation with round axis: absolute position set point value exceeds the round axis range | During operation with the rotary shaft, the absolute position must lie within the range of $0 \ldots$ <br> RotaryShaftRange. Check the position data and parameters for the rotary shaft. |
| 1124 | CI_POS_TABLE | Invalid table selected for positioning on positioning table | Check Parameter 2 for a command "MOVE_L". |

WAGO-IIO-SYSTEM 750 I/O Modules

| Error <br> No.: | Designation | Description | Possible cause/Solution |
| :---: | :---: | :---: | :---: |
| 1125 | CI_SET_POS | Actual value can not be set (e.g. while positioning task in progress) | The drive must be motionless for one SET_POS command. |
| 1141 | CM_UNKNOWN_C MDSOURCE | internal | internal |
| 1142 | CM_AUTOSTART_N OT_POSSIBLE | Autostart of a Move program not possible (not available) | Load the Move program to the module, or de-activate the autostart. |
| 1161 | CONFIG_WRITE_ SIZE | Illegal variable when writing the configuration | An attempt was made to enter an element into the configuration with a length less than 1 byte or greater than 4 bytes. |
| 1162 | CONFIG_WRONGPA SSWORD | Password not accepted | Specify a correct password |
| 1211 | CTRLOUT_FREF | Configuration: maximum frequency invalid | The maximum frequency must be between <br> 1..... 25000 . |
| 1212 | CTRLOUT_F_FREF | Maximum frequency reached | An attempt was made to specify a frequency that is greater than the maximum frequency. Check the specified target frequency and the maximum frequency values. |
| 1213 | CTRLOUT_CURREN T_SCALE | Configuration: nominal current invalid | Incorrect rated motor current specified. Check the configuration. |
| 1214 | CTRLOUT_OPERAT ION_MODE | Configuration: The selected application is not present in this module | Check the configuration value for Mode 1. |
| 1215 | CTRLOUTP_CURR_ PARAM | Configuration: current controller password does not agree with current controller parameters | Configuration: Check the parameters for current regulation with the password for current regulation. |
| 1216 | CTRLOUTP_F_DIV | Configuration: frequency prescaler faulty | Configuration: Check parameters for frequency prescaler. |
| 1217 | CTRLOUT CURREN T_FACTOR | Current setting incorrect (greater than 150\%) | Invalid parameterization for current setting, check configuration, check Move program of Mailbox commands where applicable |

| Error <br> No.: | Designation | Description | Possible cause/Solution |
| :---: | :---: | :---: | :---: |
| 1218 | CTRLOUTP_CURR_ PARAM2 | Configuration: current controller password does not agree with current controller parameters (750-673). | Configuration: Check the parameters for current regulation (750-673) with Password2 for current regulation. |
| 1241 | IO BITINDEX TOLARGE | Access to non-existing bit (internal) | Configuration, check Move program and Mailbox commands for incorrect bit addresses. |
| 1242 | IO_ILLEGAL_USER BITNR | Bit cannot be modified by user | An attempt was made to change a bit not linked to MZERO or MONE using the Move program of Mailbox command |
| 1243 | IO_USERBIT_READ ONLY | Bit cannot be written | Bit not authorized for external write access. |
| 1245 | IO_RECURSIVE_LIN | Nesting of linked bits exceeds parameters | A linkable bit was linked to a linkable bit that was linked to a linkable bit, etc.; A linkable bit may be linked to itself. |
| 1246 | IO_TIMER_1 | Configuration: filter function not defined | Check configuration for filter functions. |
| 1247 | IO_UNKNOWN_TIM ER | A filter with this number does not exist | Check configuration for filter functions. |
| 1248 | IO_TIMERMODE | Filter function does not permit write access | The current filter function configuration does not permit writing of the filter. |
| 1249 | IO BITNOT IMPLEMENTED | Requested bit not implemented (internal) | A bit being used can not be queried (internal error). |
| 1251 | IO_DIVISION_ZERO | Filter function division: division by zero | Analyze run program and ensure that the denominator can never be 0 . |
| 1261 | $\begin{aligned} & \text { MEAS-- } \\ & \text { SETPOSITION } \end{aligned}$ | For operation with the rotary axis, the command SET_POSITION was used with a position outside the rotary axis. | For this parameter, the precondition <br> Drive_Range_Neg $\leq$ setpoint position $\leq$ Drive_Range_Pos must be fulfilled. |
| 1311 | TBL_PROGRAM_ST OP1 | Motion program terminated with error message 1 | Check the termination condition of the Move program. |
| 1312 | TBL_PROGRAM_ST OP2 | Motion program terminated with error message 2 | Check the termination condition of the Move program. |

WAGO-I/O-SYSTEM 750
I/O Modules

### 4.5 Bit Field for I/O Driver

The bit functions described in this table relate to the standard application stepper positioning control

In the description of respective application it is shown when bits have significance in other applications.

The following conventions apply:

- Source bits are assigned numbers 0 to 127 and may not be used as target bits. A source bit may reference several target bits.
- Target bits are assigned numbers 128 to 255 and may also be used as source bits. Target bits have exactly one source.
- References are stored in the configuration table. The names of the table entries correspond to those in the bit table. The prefix Ptr is placed in front of the identifier.
- The standard link between the source and target is entered in the column "Target/Source". This corresponds to the WAGO default settings (FACTORY_DEFAULT_1).

| Designation | Bit number |  | Type | Default |  | Description |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :---: |
|  | Dec. | Hex. |  | Target/Source | Bit no. |  |  |
| ZERO | 0 | $0 x 00$ | SRC | 0 | - | Bit is always cleared |  |
| ONE | 1 | $0 x 01$ | SRC | 1 | - | Bit is always set |  |
| MZERO | 2 | $0 x 02$ | SRC | 0 | - | A bit linked to MZERO is originally cleared <br> after reset, but may be manipulated by mailbox <br> commands or motion programs. |  |
| MONE | 3 | $0 x 03$ | SRC | 1 |  |  |  |
| Reset | 4 | $0 x 04$ | SRC | KBUS_ST3_7 | $0 x 97$ | A bit linked to MZERO is originally set after <br> reset, but may be manipulated by mailbox <br> commands or motion programs. |  |

| Designation | Bit number |  | Type | Default |  | Description |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Dec. | Hex. |  | Target/Source | Bit no. |  |  |
| Warning | 5 | 0x05 | SRC | KBUS_ST3_6 | 0x96 | Warning status of driver A warning can be acknowledged using Error_Quit. |  |
|  |  |  |  |  |  | 0 | The drive has no warning. |
|  |  |  |  |  |  | 1 | The drive has a warning. |
| KBUS <br> Active | 6 | 0x06 | SRC | - | - | Internal data bus communication active |  |
|  |  |  |  |  |  | 0 : | Internal data bus communication for more than 100 ms |
|  |  |  |  |  |  | 1: | Internal data bus communication present |
|  | 7 | 0x07 |  |  |  |  |  |
| On_Target | 8 | 0x08 | SRC | $\begin{aligned} & \text { KBUS_ST2_0 } \\ & \text { OUT1 } \end{aligned}$ | $\begin{aligned} & 0 \mathrm{x} 88 \\ & 0 \mathrm{xA} 0 \end{aligned}$ | Target reached <br> The significance of this bit depends on the selected operating mode. |  |
|  |  |  |  |  |  | Step positioning: |  |
|  |  |  |  |  |  | 0 : | The specified target position has not been reached. |
|  |  |  |  |  |  | 1: | The specified setpoint within the target window. |
|  |  |  |  |  |  | Run program: |  |
|  |  |  |  |  |  | 0 : | TargetWindowPosition has not been reached. |
|  |  |  |  |  |  | 1: | TargetWindowPosition has been reached. |
|  |  |  |  |  |  | Referencing |  |
|  |  |  |  |  |  | 0 : | The reference point has not been approached and set. |
|  |  |  |  |  |  | 1: | The reference point has been moved to and set successfully. |
|  |  |  |  |  |  | Jog Mode: |  |
|  |  |  |  |  |  | 0 : | The bit is not used in this mode and remains at 0 . |
|  |  |  |  |  |  | 1: | The bit is not used in this mode and remains at 0 . |
|  |  |  |  |  |  | Mailbox mode: |  |
|  |  |  |  |  |  | 0: | Function of mailbox command. |
|  |  |  |  |  |  | 1 : | Function of mailbox command. |

| Designation | Bit number |  | Type | Default |  | Description |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Dec. | Hex. |  | Target/Source | Bit no. |  |  |
| Busy | 9 | 0x09 | SRC | $\begin{aligned} & \text { KBUS_ST2_1 } \\ & \text { LED E } \end{aligned}$ | $\begin{aligned} & 0 \mathrm{x} 89 \\ & 0 \mathrm{xD} 0 \end{aligned}$ | Busy: the selected operating mode is active and not yet finished. It is possible that the operating mode was cancelled. |  |
|  |  |  |  |  |  | Step positioning: |  |
|  |  |  |  |  |  | 0 : | Step positioning not running. |
|  |  |  |  |  |  | 1: | Step positioning running. |
|  |  |  |  |  |  | Run program: |  |
|  |  |  |  |  |  | 0 : | The Run program is not running. |
|  |  |  |  |  |  | 1: | The Run program is running. |
|  |  |  |  |  |  | Reference run: |  |
|  |  |  |  |  |  | 0 : | Reference run not in operation. |
|  |  |  |  |  |  | 1: | Reference run in operation. |
|  |  |  |  |  |  | Jog Mode: |  |
|  |  |  |  |  |  | 0 : | Motor at standstill. |
|  |  |  |  |  |  | 1: | The Jog mode is running, i.e. the motor has been started using Jog_Pos or Jog_Neg. |
|  |  |  |  |  |  | Mailbox mode: |  |
|  |  |  |  |  |  | 0 : | No command is active. |
|  |  |  |  |  |  | 1: | A command is active. |
| StandStill | 10 | 0x0A | SRC | KBUS_ST2_2 | 0x8A | Drive standstill, frequency output at 0 . |  |
|  |  |  |  |  |  | 0 : | Motor is turning. |
|  |  |  |  |  |  | 1: | Motor at standstill. |
| On_Speed | 11 | 0x0B | SRC | KBUS_ST2_3 | 0x8B | Drive speed reached |  |
|  |  |  |  |  |  | 0 : | The drive has not reached its setpoint speed. |
|  |  |  |  |  |  | 1: | The drive has reached its setpoint speed. |
| Direction | 12 | 0x0C | SRC | KBUS_ST2_4 | 0x8C | Direction of rotation is valid only when StandStill is not set to 1 . |  |
|  |  |  |  |  |  | 0 : | Drive moving in the negative direction. |
|  |  |  |  |  |  | 1: | Drive moving in the positive direction. |

| Designation | Bit number |  | Type | Default |  | Description |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Dec. | Hex. |  | Target/Source | Bit no. |  |  |
| $\begin{array}{\|l} \text { Reference_O } \\ \text { K } \end{array}$ | 13 | 0x0D | SRC | KBUS_ST2_5 | 0x8D | Set when reference run has been successfully concluded. |  |
|  |  |  |  |  |  | 0 : | Upon switching on of the module, the bit is set to 0 . It is also set to 0 when the reference motion is initiated. |
|  |  |  |  |  |  | 1: | The reference point has been successfully located in the reference run mode. |
| PreCalc_Ack | 14 | 0x0E | SRC | KBUS_ST2_6 | 0x8E | Setpoints from Mode 2.2 saved. <br> This bit is set when the setpoint save mode has been requested with PreCalc and precalculation of a movement has been successfully completed. |  |
|  |  |  |  |  |  | 0: | Precalculation not yet performed. |
|  |  |  |  |  |  | 1: | Precalculation performed. |
| Error | 15 | 0x0F | SRC | $\begin{aligned} & \text { KBUS_ST2_7 } \\ & \text { OUT2 } \end{aligned}$ | $\begin{aligned} & 0 \mathrm{x} 8 \mathrm{~F} \\ & 0 \mathrm{xA1} \end{aligned}$ | Drive error status. <br> An error can be acknowledged using Error_Quit. |  |
|  |  |  |  |  |  | 0 : | No error present for the drive. |
|  |  |  |  |  |  | 1: | Error present for the drive. |
| Ready | 16 | 0x10 | SRC | KBUS_ST1_0 | 0x80 | Ready |  |
|  |  |  |  |  |  | 0 : | The module is not ready for operation. Either a corresponding request is present via Enable, or an error has resulted in cancellation of Ready. When the bit switches from 1 to 0 the output stage is deactivated, or the output frequency is set to 0 . |
|  |  |  |  |  |  | 1: | Readiness for operation has been requested via Enable and no error is present. |
| $\begin{aligned} & \text { Stop_N_AC } \\ & \mathrm{K} \end{aligned}$ | 17 | 0x11 | SRC | $\begin{aligned} & \text { KBUS_ST1_1 } \\ & \text { LED G } \end{aligned}$ | $\begin{aligned} & 0 \times 81 \\ & 0 x D 2 \end{aligned}$ | Drive stop inverted |  |
|  |  |  |  |  |  | 0 : | The bit Stop1_N or Stop2_N is set to 0 . The motor is set to 0 (StandStill set to 1 ). Start can not be used to start up the unit. |
|  |  |  |  |  |  | 1: | The bits Stop1_N and Stop2_N are both set to 1 , or the drive is braking the unit. |

WAGO-I/O-SYSTEM 750 I/O Modules

| Designation | Bit number |  | Type | Default |  | Description |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Dec. | Hex. |  | Target/Source | Bit no. |  |
| Start_ACK | 18 | 0x12 | SRC | KBUS_ST1_2 | 0x82 | Start process in operating mode |
|  |  |  |  |  |  | $0:$ $\begin{array}{l}\text { This bit is also set to } 0 \text { when the Start } \\ \text { request is canceled. }\end{array}$ |
|  |  |  |  |  |  | 1: The rising edge function is a function of the selected operating mode. |
|  |  |  |  |  |  | Single positioning <br> Speed control <br> The specified setpoint have been accepted from the process image. |
|  |  |  |  |  |  | Run program <br> The run program has been started. |
|  |  |  |  |  |  | Referencing <br> The reference run has been started. |
|  |  |  |  |  |  | JogMode <br> No effect. Handshake not performed. |
|  |  |  |  |  |  | Mailbox mode Handshake not performed. As soon as the mailbox mode has been enabled, the corresponding commands can be transmitted via the mailbox. |
| $\begin{aligned} & \text { Command_A } \\ & \text { CK[1] } \end{aligned}$ | 19 | 0x13 | SRC | KBUS_ST1_3 | 0x83 | Selecting the operating mode <br> 0: Idle mode <br> 1: Single positioning <br> For this operating mode, the mailbox must be disabled. <br> 2: Run program <br> Speed Control <br> Reference motion <br> JogMode <br> The drive can be operated manually at the setup speed. <br> Control is performed via Input3 (Jog_Pos) and Input4 (Jog_Neg) <br> Run commands via mailbox <br> 16: In this mode, all movement commands are issued directly via mailbox. |
| $\begin{array}{\|l} \hline \text { Command_A } \\ \text { CK[2] } \\ \hline \end{array}$ | 20 | 0x14 | SRC | KBUS_ST1_4 | 0x84 |  |

| Enable | 176 | 0xB0 | $\begin{aligned} & \text { DST/ } \\ & \text { SRC } \end{aligned}$ | $\begin{aligned} & \text { KBUS_CTRL1 } \\ & 0 \end{aligned}$ | 0x40 | Module enable. Contrary to Enable_Drive, this bit must be set to activate an operating mode. |  |
|  |  |  |  |  |  | 0: | The module is blocked. When this bit is reset during ongoing operation, the power output stage is switched off. This bit terminates the current operating mode. |
|  |  |  |  |  |  | 1: | The module is enabled and can be started when the corresponding return message is also available in the status. |
| Stop2_N | 177 | 0xB1 | $\begin{aligned} & \text { DST/ } \\ & \text { SRC } \end{aligned}$ | $\begin{aligned} & \text { KBUS_CTRL1 } \\ & \text { _1 } \end{aligned}$ | 0x41 | Drive Stop 2 inverted. <br> With this bit, the drive can be turned off from the control. This bit must be set to activate an operating mode. <br> The return message is transmitted via the Stop_N_ACK bit. Stop1_N and Stop2_N are always taken into account at that bit. |  |
|  |  |  |  |  |  | 0 : | Current is being supplied to the motor, but it is at standstill. If the motor still rotates, it will be driven to stand still by the STOP acceleration. The motor can not be started up. |
|  |  |  |  |  |  | 1: | The drive may be started. |

WAGO-I/O-SYSTEM 750 I/O Modules

| Designation | Bit number |  | Type | Default |  | Description |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Dec. | Hex. |  | Target/Source | Bit no. |  |
| Start | 178 | 0xB2 | $\begin{aligned} & \text { DST/ } \\ & \text { SRC } \end{aligned}$ | $\begin{aligned} & \text { KBUS_CTRL1 } \\ & { }_{2} 2 \end{aligned}$ | 0x42 | Start-up of drive <br> The drives, or frequency output, are started in the selected mode on the positive edge. If the edge is not accepted (in the Jog or Mailbox mode), an error message is generated. |
|  |  |  |  |  |  | $0 \rightarrow 1: \quad \begin{aligned} & \text { The drive is started accordingly on the } \\ & \text { rising edge. }\end{aligned}$ |
|  |  |  |  |  |  | Single positioning <br> Speed control <br> The specified setpoints are accepted from the process image. Movement is made directly to the new target, even if the drive is already turning. <br> A previously calculated movement sequence is started immediately when the PreCalc_ACK bit is set (instant setpoint switch). |
|  |  |  |  |  |  | Run Program <br> The run program is started at the Start_Instruction_Counter address in the process image. A run program that is currently running is interrupted, and the program flow is started at the new address. This allows various program parts to be transferred via the process image. |
|  |  |  |  |  |  | Referencing <br> The reference run is initiated. If the reference run is still in operation, the (new) setpoints are again accepted and calculated (same procedure as for positioning). The reference run is newly initiated. |
|  |  |  |  |  |  | JogMode <br> No effect. <br> The drive is started in JogMode by default via Input3 (Jog_Pos) or Input4 (Jog_Neg). <br> The inputs and outputs can be freely reconfigured. <br> An error message is generated. |
|  |  |  |  |  |  | Mailbox mode <br> No effect in this operating mode. The command is carried out via the mailbox. If the bit is set nonetheless, neither an acknowledgment nor an error message is generated. |

| Designation | Bit number |  | Type | Default |  | Description |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Dec. | Hex. |  | Target/Source | Bit no. |  |  |
| Command[1] | 179 | 0xB3 | $\begin{aligned} & \text { DST/ } \\ & \text { SRC } \end{aligned}$ | $\begin{aligned} & \text { KBUS_CTRL1 } \\ & -3 \end{aligned}$ | 0x43 | Operating mode Single positioning For this operating mode, the mailbox must be disabled. |  |
|  |  |  |  |  |  | 0 : | The Step positioning mode is not active (selected). |
|  |  |  |  |  |  | 1: | Operating mode Single positioning is selected. |
| Command[2] | 180 | 0xB4 | $\begin{aligned} & \text { DST/ } \\ & \text { SRC } \end{aligned}$ | $\begin{aligned} & \text { KBUS_CTRL1 } \\ & \hline \end{aligned}$ | 0x44 | Operating mode Run program |  |
|  |  |  |  |  |  | 0 : | The Run program mode is not active (selected). |
|  |  |  |  |  |  | 1: | The Run program mode has been selected. |
| Command[3] | 181 | 0xB5 | $\begin{aligned} & \text { DST/ } \\ & \text { SRC } \end{aligned}$ | $\begin{aligned} & \text { KBUS_CTRL1 } \\ & { }_{-} 5 \end{aligned}$ | 0x45 | Reference run operating mode |  |
|  |  |  |  |  |  | 0: | Reference run operating mode is not selected. |
|  |  |  |  |  |  | 1: | Reference run operating mode is selected. |
| Command[4] | 182 | 0xB6 | $\begin{array}{\|l} \text { DST/ } \\ \text { SRC } \end{array}$ | $\begin{aligned} & \text { KBUS_CTRL1 } \\ & -6 \end{aligned}$ | 0x46 | Jog mode. <br> The drive can be run manually at the setup speed when the Jog mode is active. Control is implemented using Direction_Pos and Direction_Neg. |  |
|  |  |  |  |  |  | 0 : | The Jog mode is not active (selected). |
|  |  |  |  |  |  | 1: | The Jog mode has been selected. |
| Command[5] | 183 | 0xB7 | $\begin{aligned} & \text { DST/ } \\ & \text { SRC } \end{aligned}$ | $\begin{array}{\|l} \text { KBUS_CTRL1 } \\ -7 \end{array}$ | 0x47 | Mailbox mode. <br> For this operating mode, all motion commands are given directly via the mailbox. |  |
|  |  |  |  |  |  | 0 : | The Mailbox mode is not active (selected). |
|  |  |  |  |  |  | 1: | The Mailbox mode has been selected. |
| Enable_Drive | 184 | 0xB8 | $\begin{aligned} & \hline \text { DST/ } \\ & \text { SRC } \end{aligned}$ | ONE | 0x01 | Enabling output stage. <br> The output stage can be inhibited directly by deleting this bit. Contrary to Enable, this bit does not have any further effects on internal processing. The output stage is only enabled when Enable has been set and all other enable conditions are fulfilled. <br> This bit is linked to ONE by default. |  |
|  |  |  |  |  |  | 0 : | Output stage inhibited. |
|  |  |  |  |  |  | 1: | Output stage can be enabled. |

WAGO-I/O-SYSTEM 750 I/O Modules

| Designation | Bit number |  | Type | Default |  | Description |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Dec. | Hex. |  | Target/Source | Bit no. |  |  |
| Reset_Quit | 185 | 0xB9 | $\begin{aligned} & \hline \text { DST/ } \\ & \text { SRC } \end{aligned}$ | $\begin{aligned} & \text { KBUS_CTRL3 } \\ & -7 \end{aligned}$ | 0x57 | Reset acknowledgement |  |
|  |  |  |  |  |  | 0 : | Function not defined. |
|  |  |  |  |  |  | 1: | The Reset signal is reset. |
| Direction Pos | 186 | 0xBA | $\begin{array}{\|l} \text { DST/ } \\ \text { SRC } \end{array}$ | $\begin{aligned} & \text { KBUS_CTRL3 } \\ & \text { _2 } \end{aligned}$ | 0x52 | In reference run operating mode, this bit establishes that the reference switch is searched for in positive direction. |  |
|  |  |  |  |  |  | 0 : | Drive not to move in a positive direction. |
|  |  |  |  |  |  | 1: | Drive should move in a positive direction. The drive is deactivated when the bit Direction_Neg is set at the same time. |
| Direction <br> Neg | 187 | 0xBB | $\begin{aligned} & \text { DST/ } \\ & \text { SRC } \end{aligned}$ | $\begin{aligned} & \text { KBUS_CTRL3 } \\ & -3 \end{aligned}$ | 0x53 | In reference run operating mode, this bit establishes that the reference switch is searched for in negative direction. |  |
|  |  |  |  |  |  | 0 : | Drive not to move in a negative direction. |
|  |  |  |  |  |  | 1: | Drive should move in a negative direction. The drive is deactivated when the bit Direction_Pos is set at the same time. |
| Set <br> Reference | 188 | 0xBC | $\begin{aligned} & \text { DST/ } \\ & \text { SRC } \end{aligned}$ | Input2 | 0x31 | Reference input <br> Input 2 is set to this bit in the standard configuration. |  |
|  |  |  |  |  |  | 0: | The reference switch is not actuated. |
|  |  |  |  |  |  | 1: | The reference switch is actuated. |
| PreCalc | 189 | 0xBD | DST/ SRC | $\begin{aligned} & \text { KBUS_CTRL2 } \\ & -6 \end{aligned}$ | 0x4E | Save setpoints from Module 2.2 and, where applicable, calculate a movement sequence in advance. |  |
|  |  |  |  |  |  | 0 : | Each setpoint that is transmitted via cyclic telegram traffic must be accepted and processed. A possibly pre-calculated movement process will be discarded. A movement sequence can be calculated and started using Start. |
|  |  |  |  |  |  | 1: | The setpoints from the cyclic telegram traffic are ignored and the setpoint saved for the $0 \rightarrow 1$ edge used instead. If the starting speed is zero, a movement sequence will be calculated in advance using this setpoint; this sequence can then be started with the normal delay using Start. |

| Designation | Bit number |  | Type | Default |  | Description |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Dec. | Hex. |  | Target/Source | Bit no. |  |  |
| SetupSpeed Active | 190 | 0xBE | $\begin{array}{\|l} \text { DST/ } \\ \text { SRC } \end{array}$ | MZERO | 0x02 | Setup mode selected. <br> When the bit SetupSpeed_Active_ACK is set the drive speed is limited to the defined setup speed. |  |
|  |  |  |  |  |  | 0 : | Setup mode not selected. |
|  |  |  |  |  |  | 1: | Setup mode selected. |
| Error_Quit | 191 | 0xBF | $\begin{aligned} & \text { DST/ } \\ & \text { SRC } \end{aligned}$ | $\begin{aligned} & \text { KBUS_CTRL2 } \\ & -7 \end{aligned}$ | 0x4F | Acknowledge error. <br> All errors that are present are acknowledged at the rising edge from 0 to 1 . After acknowledgement, the error switches to 0 , or a new error is present: |  |
| $\begin{aligned} & \text { LimitSwitch_ } \\ & \text { Pos } \end{aligned}$ | 192 | 0xC0 | SRC | Input5 | 0x34 | Limit switch input on movement in positive direction. A direct input exists for this function. |  |
|  |  |  |  |  |  | 0 : | The positive direction limit switch is not actuated. |
|  |  |  |  |  |  | 1 : | The positive direction limit switch is actuated. The drive is ramped down. |
| LimitSwitch <br> Neg | 193 | 0 xC 1 | SRC | Input6 | 0x35 | Limit switch input on movement in negative direction. <br> A direct input exists for this function. |  |
|  |  |  |  |  |  | 0 : | The positive direction limit switch is not actuated. |
|  |  |  |  |  |  | $1:$ | The positive direction limit switch is actuated. The drive is ramped down. |
| Stop1_N | 194 | 0xC2 | $\begin{aligned} & \text { DST/ } \\ & \text { SRC } \end{aligned}$ | Input1 | 0x30 | Drive Stop 1 inverted. <br> This bit is linked to input 1 of the terminal. The return message is transmitted via Stop_N bit. Stop1_N and Stop2_N are always taken into account at that bit. |  |
|  |  |  |  |  |  | 0 : | Current is being supplied to the motor, but it is at standstill. If the motor still rotates, it will be driven to stand still by the STOP acceleration. The motor can not be started up. |
|  |  |  |  |  |  | 1: | The drive may be started. |
| Brake Manual | 195 | 0xC3 | $\begin{array}{\|l} \text { DST/ } \\ \text { SRC } \end{array}$ | MZERO | 0x02 |  | al actuation of brake |

| Designation | Bit number |  | Type | Default |  | Description |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Dec. | Hex. |  | Target/Source | Bit no. |  |  |  |

### 4.6 Configuration Variables

| Configuration variable | Address |  | Data type: | Default: | Range: | Description |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Dec. | Hex. |  |  |  |  |
| User_Conf_ld | 0 | 0x00 | UINT16 | 0 | 0 ... 50000 | The dataset number can be freely assigned by the user. Numbers above 50000 are reserved. |
| ConfVersion | 2 | 0x02 | UINT8 | 4 | 0 ... 254 | Configuration version number. <br> This number identifies the structure of the dataset. (Order and length of the data.) If it becomes necessary to expand the dataset within the framework of future expansions, the number will be adjusted accordingly. The software can only read a dataset that is known. Other dataset numbers are rejected. |
| Application Selector | 3 | 0x03 | UINT8 | 1 | 1 | Switching of the application The appropriate process image is activated when a new application is selected. |
|  |  |  |  |  |  | 0: Reserved |
|  |  |  |  |  |  | 1: Positioning controller |
| Freq_Div | 4 | 0x04 | UINT16 | 40 | 4 ... 32767 | Sets the prescaler for maximum speed, only valid when the bits <br> Freq_Range_Sel_0 and <br> Freq_Range_Sel_1 are zero. |
| Acc_Fact | 6 | 0x06 | UINT16 | 1000 | 1... 32767 | Sets the factor for maximum acceleration, only valid if bits Acc_Range_Sel_0 and Acc_Range_Sel_1 are zero. |
| Current | 14 | 0x0E | UINT8 | 50 | $0 \ldots 50$ | Motor rated current in [0.1 A] |
| Current_Ratio StandStill | 15 | 0x0F | UINT8 | 33 | 0 ... 150 | Current factor at standstill in [\%], based on motor rated current "Current". <br> A value of " 0 " blocks the modulation. |
| Current_Ratio RampUp | 16 | 0x10 | UINT8 | 100 | 0 ... 150 | Current factor for ramp-down in [\%], based on motor rated current "Current". A value of " 0 " blocks the modulation. |
| Current_Ratio Drive | 17 | 0x11 | UINT8 | 50 | 0 ... 150 | Current factor for drive in [\%], based on motor rated current "Current". A value of "0" blocks the modulation. |
| Current_Ratio RampDown | 18 | 0x12 | UINT8 | 100 | 0 ... 150 | Current factor for ramp-down in [\%], based on motor rated current "Current". A value of " 0 " blocks the modulation. |
